Contacting Varian Customer Support

Varian Customer Support is available on the internet, by e-mail, and by telephone. Support services are available without charge during the initial warranty period.

The my.varian.com website provides contact information, product documentation, and other resources for all Varian products.

Get Online Customer Support

You can browse the my.varian.com site without having a Varian account or logging in. However, you must have a Varian account to get online customer support and to access product information for products at your institution or clinic.

1. Go to <http://my.varian.com>.
2. Click Contact Us at the top of the window to display customer support and training options, and international e-mail addresses and telephone numbers.
3. Choose an option:
 - ◆ If you do not already have an account, click Create New Account and follow the instructions. Establishing an account may take a few days.
 - ◆ If you have an account, go to the next step.
4. Enter your user name and password.
5. Browse the information and then click the link that corresponds to what you want to do:
 - ◆ Fill out and submit a support request.
 - ◆ Find documents. Online documents in PDF format include customer technical bulletins (CTBs,) manuals, and customer release notes (CRNs).
 - ◆ Send an e-mail to Varian support. You can browse for international e-mail addresses and telephone numbers by geographic area, and for oncology-specific contacts such as for brachytherapy.
 - ◆ Find parts and services by geographical area.

E-Mailing Varian

Send e-mail inquiries through the my.varian.com website.

Alternatively, you can use a support e-mail address that corresponds to your location or interest:

Location	E-mail Address
North America	support-americas@varian.com
Latin America	soporte.al@varian.com
Europe	support-emea@varian.com
Australia and New Zealand	support-anz@varian.com

Location	E-mail Address
China	support-china@varian.com
Japan	support-japan@varian.com
South East Asia	support-sea@varian.com
Brachytherapy Systems	brachyhelp@varian.com

Ordering Documents by Phone

You can order documents by phone by calling Varian Medical Systems support.

Location	Telephone Number
North America	+ 1 888 827 4265 (Press 2 for parts)
Global	Call your local Varian office.

Visual Cues

This publication uses the following visual cues to help you find information:

WARNING: A warning describes actions or conditions that can result in serious injury or death.

CAUTION: A caution describes hazardous actions or conditions that can result in minor or moderate injury.

NOTICE: A notice describes actions or conditions that can result in damage to equipment or loss of data.

Note: A note describes information that may pertain to only some conditions, readers, or sites.

Tip: A tip describes useful but optional information such as a shortcut, reminder, or suggestion, to help get optimal performance from the equipment or software.

Notice

Information in this user guide is subject to change without notice and does not represent a commitment on the part of Varian. Varian is not liable for errors contained in this user guide or for incidental or consequential damages in connection with furnishing or use of this material.

This document contains proprietary information protected by copyright. No part of this document may be reproduced, translated, or transmitted without the express written permission of Varian Medical Systems, Inc.

FDA 21 CFR 820 Quality System Regulations (CGMPs)

Varian Medical Systems, Oncology Systems products are designed and manufactured in accordance with the requirements specified within this federal regulation.

ISO 13485

Varian Medical Systems, Oncology Systems products are designed and manufactured in accordance with the requirements specified within the ISO 13485 quality standard.

CE

Varian Medical Systems, Oncology Systems products meet the requirements of Council Directive MDD 93/42/EEC.

IEC62083

Eclipse™ Treatment Planning System is IEC62083:2009 compliant.

EU REACH SVHC Disclosure

The link to the current EU REACH SVHC disclosure statement can be found at <http://www.varian.com/us/corporate/legal/reach.html>

HIPAA

Varian's products and services are specifically designed to include features that help our customers comply with the Health Insurance Portability and Accountability Act of 1996 (HIPAA). The software application uses a secure login process, requiring a user name and password, that supports role-based

access. Users are assigned to groups, each with certain access rights, which may include the ability to edit and add data or may limit access to data. When a user adds or modifies data within the database, a record is made that includes which data were changed, the user ID, and the date and time the changes were made. This establishes an audit trail that can be examined by authorized system administrators.

VMS.TPS.Common.Model.API Namespace Eclipse Scripting API

The VMS.TPS.Common.Model.API contains the object model of the Eclipse Scripting API.

Classes

Class	Description
<u>AddOn</u>	Represents an add-on, which is a beam modifying device that is inserted into a beam in an accessory slot of the external beam machine. An add-on is used to shape the beam or modulate its intensity or both. Add-ons are blocks, MLCs, wedges, compensators, applicators, a tray, and other devices or materials that can be fixed to a tray to be mounted into an accessory slot.
<u>AddOnMaterial</u>	Add-on material describes the dosimetric and physical properties of the metal alloy or other substance used to create the add-on.
<u>ApiDataObject</u>	The base class of objects in the Eclipse Scripting API.
<u>Application</u>	The main application interface.
<u>Applicator</u>	An applicator add-on, either an electron applicator or cone applicator.
<u>Beam</u>	Represents one beam (also referred to as "field") of an external beam treatment plan. See the definition of DICOM RT Beam for more details.
<u>BeamCalculationLog</u>	Represents a beam calculation log.
<u>BeamDose</u>	Represents a dose that is connected to a Beam.
<u>Block</u>	Represents a block add-on, a custom-made beam collimating material fixed to a tray, used to shape the beam.
<u>Bolus</u>	Represents a bolus, which is custom-made material that is usually fixed to the patient's skin for treatment. The bolus is used to modulate the depth dose profile of a beam.
<u>BrachyPlanSetup</u>	Represents a brachytherapy treatment plan.
<u>BrachySolidApplicator</u>	Represents a brachytherapy solid applicator part, such as a tandem or ovoid in a Fletcher Suit Delclos (FSD) applicator set. This class holds only the metadata related to the solid applicator

Â	Class	Description
	<u>BrachyTreatmentUnit</u>	part, and links to the <u>catheters</u> that are part of the solid applicator. Represents a brachytherapy afterloader. Represents a brachytherapy catheter or an applicator channel centerline. Catheters are associated with a <u>brachytherapy treatment unit</u> , a <u>channel number</u> , and possibly a <u>unique identifier</u> of the <u>solid applicator part</u> they belong to. Most notably, catheters encapsulate the <u>shape</u> of the applicator channel centerline and its <u>source positions</u> .
	<u>Catheter</u>	Represents a beam compensator add-on, a custom-made beam modulating material fixed to a tray, used to modulate the beam's intensity.
	<u>Compensator</u>	Represents a point in a planned sequence of treatment beam parameters. See the definition of control points in a DICOM RT Beam.
	<u>ControlPoint</u>	Represents a collection of machine parameters that describe the planned treatment beam.
	<u>ControlPointCollection</u>	A course represents the course of treatment that a patient will be given. Every patient must have a course, and all plans always belong to a course.
	<u>Course</u>	Represents a diagnosis of the patient.
	<u>Diagnosis</u>	Represents a 3D dose grid.
	<u>Dose</u>	Represents Dose Volume Histogram (DVH) data.
	<u>DVHData</u>	A Dynamic Wedge is formed by a moving jaw of a standard collimator during irradiation.
	<u>DynamicWedge</u>	An Enhanced Dynamic Wedge is similar to a Dynamic Wedge, but it features more wedge angles than a simple Dynamic Wedge.
	<u>EnhancedDynamicWedge</u>	Represents an estimated Dose Volume Histogram (DVH) curve.
	<u>EstimatedDVH</u>	Obsolete. Use the ExternalBeamTreatmentUnit class instead.
	<u>ExternalBeam</u>	Represents a treatment machine used for delivering external beam radiotherapy.
	<u>ExternalBeamTreatmentUnit</u>	

Â	Class	Description
	<u>ExternalPlanSetup</u>	Represents an external beam plan. For more information, see the definition of the DICOM RT Plan.
	<u>FieldReferencePoint</u>	This object links a treatment beam to a reference point.
	<u>Fractionation</u>	The fractionation scheme of a plan. See the definitions of the applicable parts of DICOM RT Fraction Scheme for more details.
	<u>Globals</u>	This class is internal to the Eclipse Scripting API.
	<u>Hospital</u>	Represents a hospital.
	<u>Image</u>	Represents a 2D or 3D image, which can be a DRR, a CT, MR, or other volumetric dataset.
	<u>Isodose</u>	Represents an isodose level for a fixed absolute or relative dose value.
	<u>MLC</u>	Represents a Multileaf Collimator (MLC) add-on.
	<u>MotorizedWedge</u>	A motorized wedge is a standard wedge placed in the beam for a user-defined fraction of the total treatment time.
	<u>OmniWedge</u>	An OmniWedge is a special type of wedge that combines an open field, a motorized wedge, and a virtual wedge to create the desired wedge effect.
	<u>OptimizationEUDObjective</u>	A gEUD objective is an exact, upper or lower objective. An exact gEUD objective defines an exact dose value that a target structure should receive. An upper gEUD objective defines the maximum dose value that a structure should receive. A lower gEUD objective defines the minimum dose value that a target structure should receive. Generalized Equivalent Uniform Dose (gEUD) is a uniform dose that, if delivered over the same number of fractions, yields the same radiobiological effect as the non-uniform dose distribution of interest.
	<u>OptimizationExcludeStructureParameter</u>	Structures that have this parameter are excluded from the optimization.
	<u>OptimizationIMRTBeamParameter</u>	Beam-specific optimization parameter for IMRT optimization.
	<u>OptimizationJawTrackingUsedParameter</u>	An optimization parameter for using jaw tracking in VMAT optimization. The

Â	Class	Description
		parameter exists if OptimizationSetup.UseJawTracking has been set to true.
	<u>OptimizationLineObjective</u>	A line objective is a collection of point objectives that have the same priority. It is used to limit the dose in a given structure.
	<u>OptimizationMeanDoseObjective</u>	A mean objective defines the mean dose that should not be exceeded. The mean objective is used to decrease the dose that a structure receives.
	<u>OptimizationNormalTissueParameter</u>	An optimization parameter for the normal tissue objective.
	<u>OptimizationObjective</u>	Provides a common base type for all structure-specific optimization objectives.
	<u>OptimizationParameter</u>	Provides a common base type for all optimization parameters.
	<u>OptimizationPointCloudParameter</u>	Structure-specific parameter for point cloud optimization. Relevant if the optimization algorithm uses a point cloud. The point cloud parameters are automatically created with default values when you add other structure-specific parameters or objectives in the optimization setup.
	<u>OptimizationPointObjective</u>	A point objective is either an upper or lower objective. An upper objective is used to limit the dose in a given structure. A lower objective is used to define the desired dose levels in target structures.
	<u>OptimizationSetup</u>	Gives access to the optimization parameters and objectives.
	<u>Patient</u>	Represents a patient.
	<u>PatientSummary</u>	Basic information about the patient.
	<u>PlanningItem</u>	Common properties of a treatment plan and a plan sum.
	<u>PlanningItemDose</u>	Represents a dose that is connected to a plan setup or a plan sum.
	<u>PlanSetup</u>	Represents a treatment plan. See the definition of a DICOM RT Plan for more information.
	<u>PlanSum</u>	A plan sum describes the cumulative dose summation of several treatment plans. It can be used, for example, to

Â	Class	Description
		evaluate the dose the patient received from a treatment plan and boost plan together.
	<u>PlanSumComponent</u>	Represents a component plan of a plan sum.
	<u>RadioactiveSource</u>	Represents a radioactive source installed into a <u>brachytherapy treatment unit</u> or a seed of a <u>seed collection</u> .
	<u>RadioactiveSourceModel</u>	The radioactive source model represents the details of the radioactive source used in brachytherapy. It encapsulates the source isotope, dimensions, and dose calculation parameters.
	<u>ReferencePoint</u>	A reference point associated with a patient.
	<u>Registration</u>	Represents the spatial registration matrix between two frames of reference.
	<u>ScriptContext</u>	Contains the runtime context information of the active application for the script.
	<u>SeedCollection</u>	Represents a collection of brachytherapy <u>seed positions</u> . Each position is also associated with a radioactive source.
	<u>SerializableObject</u>	Base class for objects that can be serialized.
	<u>Series</u>	A series is a collection of radiation therapy objects of a patient. The series is part of a study. See the definition of a DICOM Series for more information.
	<u>Slot</u>	A slot is the location (typically on the collimator head of the gantry) where an add-on, such as a wedge or block, is mounted.
	<u>SourcePosition</u>	Represents a brachytherapy source dwell position in a <u>catheter</u> or a seed position in a <u>seed collection</u> .
	<u>StandardWedge</u>	A standard wedge is a physical piece of material with an angle that is static during treatment.
	<u>Structure</u>	A structure is a geometrical representation of an anatomical organ, a treatment volume, a marker, or a support structure. See the definition of a DICOM Structure for more information.
	<u>StructureSet</u>	A structure set is a container for structures of a patient, including

Â	Class	Description
		anatomical organs, treatment volumes and markers, and support structures.
	<u>Study</u>	A study is a collection of series.
	<u>Technique</u>	Treatment technique used for a beam. Can be, for example, static or arc.
	<u>Tray</u>	A tray add-on is a plate where blocks, compensators, and other beam modifying materials can be fixed to. The tray is inserted into a slot during the treatment of a beam.
	<u>User</u>	Represents a user.
	<u>Wedge</u>	A wedge is a beam modulating add-on that modifies the dose intensity over all or a part of a treatment beam.

ApiDataObject.Equals MethodEclipse
Scripting
API

Determines whether the specified Object is equal to the current Object.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public override bool Equals(
    Object obj
)
```

```
public override bool Equals(
    Object obj
)
```

Parameters

obj

Type: [System.Object](#)

Object to compare with the current object

Return Value

Type: [Boolean](#)

True if the specified Object is equal to the current Object; otherwise, false.

    string password
)
```

```
public static Application CreateApplication(
    string username,
    string password
)
```

Parameters

username

Type: System.String

Username for logging in or null value to invoke an interactive login dialog.

password

Type: System.String

Password for logging in or null value to invoke an interactive login dialog

Return Value

Type: Application

Application object that is the root of the datamodel.

Remarks

Code that uses this API must run on a single-threaded apartment (STAThread). Dispose must be called before the program exits. Only one Application instance may be created during the entire run of the program.

Applicator Properties Eclipse Scripting API

The [Applicator](#) type exposes the following members.

Properties

Â	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CreationDateTime	The date when this object was created. (Inherited from AddOn .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)

Beam Members Eclipse Scripting API

The [Beam](#) type exposes the following members.

Methods

Â	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetOptimalFluence	Gets the optimal fluence for this beam. Returns null if optimal fluence does not exist.
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetSourceLocation	Returns the location of the radiation source at a given gantry angle of the beam.
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Â	Name	Description
	Applicator	An applicator is a specific add-on used in the beam.
	ArcLength	The arc length.
	AverageSSD	The average Source-to-Skin Distance (SSD) of an arc beam.
	BeamNumber	DICOM RT Beam Number. The value is unique within the plan in which it is created.
	Blocks	A collection of installed blocks.
	Boluses	A collection of beam boluses.
	CalculationLogs	A collection of beam calculation logs.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Compensator	The compensator.
	ControlPoints	An enumerable sequence of machine parameters that describe the planned treatment beam.
	CreationDateTime	The date when this object was created.
	Dose	The dose for this beam. Returns null if dose is not calculated.

Â	Name	Description
	<u>DoseRate</u>	The dose rate of the treatment machine in MU/min.
	<u>DosimetricLeafGap</u>	The dosimetric leaf gap that has been configured for the Dynamic Multileaf Collimator (DMLC) beams in the system. The dosimetric leaf gap is used for accounting for dose transmission through rounded MLC leaves.
	<u>EnergyModeDisplayName</u>	The display name of the energy mode. For example '18E' or '6X-SRS'.
	<u>ExternalBeam</u>	Obsolete. This property will be removed in a future Scripting API version. Use the TreatmentUnit property instead.
	<u>FieldReferencePoints</u>	A collection of field reference points.
	<u>GantryDirection</u>	The gantry rotation direction: clockwise (CW), counterclockwise (CCW), or none.
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from ApiDataObject .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	<u>Id</u>	The identifier of the Beam.
	<u>IsocenterPosition</u>	The position of the isocenter.
	<u>IsSetupField</u>	Checks if a beam is a setup field.
	<u>Meterset</u>	The meterset value of the beam.
	<u>MetersetPerGy</u>	The calculated meterset/Gy value for the beam.
	<u>MLC</u>	Returns a hardware description of the Multileaf Collimator (MLC) used in an MLC plan, or null if no MLC exists.
	<u>MLCPlanType</u>	The type of the Multileaf Collimator (MLC) plan.
	<u>MLCTransmissionFactor</u>	The transmission factor of the Multileaf Collimator (MLC) material.
	<u>Name</u>	The name of the object. (Inherited from ApiDataObject .)
	<u>NormalizationFactor</u>	The beam normalization factor.
	<u>NormalizationMethod</u>	The beam normalization method.
	<u>PlannedSSD</u>	The Source-to-Skin Distance (SSD) value defined by the user.
	<u>ReferenceImage</u>	The reference image of the beam.
	<u>SetupTechnique</u>	The setup technique.
	<u>SSD</u>	The Source-to-Skin Distance (SSD). For arc beams, the SSD at the start angle. This value is calculated from the geometrical setup of the beam.
	<u>SSDAtStopAngle</u>	The Source-to-Skin Distance (SSD) at the stop angle of an arc beam. This value is calculated from the geometrical setup of the beam.
	<u>Technique</u>	The technique used in the planning beam.
	<u>ToleranceTableLabel</u>	

Â	Name	Description
		User-defined label for the referenced tolerance table, or an empty string if there is no reference to a tolerance table.
	<u>Trays</u>	A collection of installed trays.
	<u>TreatmentUnit</u>	The external beam treatment unit associated with this beam.
	<u>Wedges</u>	A collection of installed wedges.
	<u>WeightFactor</u>	The weight factor of the beam.
	<u>Back to Top</u>	
	<u>See Also</u>

BeamDose Members Eclipse Scripting API

The [BeamDose](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetDoseProfile	Gets the dose profile. (Inherited from Dose .)
	GetDoseToPoint	Gets the point dose at a specified location. (Inherited from Dose .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVoxels	Gets the voxels of the given dose plane. (Inherited from Dose .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	VoxelToDoseValue	Converts the given raw voxel value to the corresponding dose value. (Inherited from Dose .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides Dose . WriteXml(XmlWriter) .)

[Back to Top](#)

[Properties](#)

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DoseMax3D	The maximum dose. (Inherited from Dose .)
	DoseMax3DLocation	The location of the maximum dose. (Inherited from Dose .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Isodoses	A collection of isodoses. (Inherited from Dose .)
	Name	The name of the object.

Â	Name	Description
		(Inherited from ApiDataObject .)
	Origin	The origin of the dose matrix. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first dose plane. (Inherited from Dose .)
	Series	Returns the series that contains the dose, or null if the dose is not connected to a series. (Inherited from Dose .)
	SeriesUID	Returns the DICOM UID of the series that contains the dose, or an empty string if the dose is not connected to a series. (Inherited from Dose .)
	UID	The DICOM UID of the dose. (Inherited from Dose .)
	XDirection	The direction of the x-axis in the dose matrix. (Inherited from Dose .)
	XRes	The dose matrix resolution in X-direction in millimeters. (Inherited from Dose .)
	XSize	The dose matrix size in X-direction in voxels. (Inherited from Dose .)
	YDirection	The direction of the y-axis in the dose matrix. (Inherited from Dose .)
	YRes	The dose matrix resolution in Y-direction in millimeters. (Inherited from Dose .)
	YSize	The dose matrix size in Y-direction in voxels. (Inherited from Dose .)
	ZDirection	The direction of the z-axis in the dose matrix. (Inherited from Dose .)
	ZRes	The dose matrix resolution in Z-direction in millimeters. (Inherited from Dose .)
	ZSize	The dose matrix size in Z-direction in voxels. (Inherited from Dose .)

BeamDose Properties Eclipse Scripting API

The BeamDose type exposes the following members.

Properties

Ã	Name	Description
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>DoseMax3D</u>	The maximum dose. (Inherited from <u>Dose</u> .)
	<u>DoseMax3DLocation</u>	The location of the maximum dose. (Inherited from <u>Dose</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Isodoses</u>	A collection of isodoses. (Inherited from <u>Dose</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Origin</u>	The origin of the dose matrix. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first dose plane. (Inherited from <u>Dose</u> .)
	<u>Series</u>	Returns the series that contains the dose, or null if the dose is not connected to a series. (Inherited from <u>Dose</u> .)
	<u>SeriesUID</u>	Returns the DICOM UID of the series that contains the dose, or an empty string if the dose is not connected to a series. (Inherited from <u>Dose</u> .)
	<u>UID</u>	The DICOM UID of the dose. (Inherited from <u>Dose</u> .)
	<u>XDirection</u>	The direction of the x-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>XRes</u>	The dose matrix resolution in X-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>XSize</u>	The dose matrix size in X-direction in voxels. (Inherited from <u>Dose</u> .)
	<u>YDirection</u>	The direction of the y-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>YRes</u>	The dose matrix resolution in Y-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>YSize</u>	The dose matrix size in Y-direction in voxels. (Inherited from <u>Dose</u> .)

Â	Name	Description
	<u>ZDirection</u>	The direction of the z-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>ZRes</u>	The dose matrix resolution in Z-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>ZSize</u>	The dose matrix size in Z-direction in voxels. (Inherited from <u>Dose</u> .)

Block Members Eclipse Scripting API

The [Block](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter).)

[Back to Top](#)

Properties

Ã	Name	Description
	AddOnMaterial	The dosimetric material of the block.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	IsDiverging	Checks if the block cut is diverging.
	Name	The name of the object. (Inherited from ApiDataObject .)
	TransmissionFactor	The transmission factor of the selected material.
	Tray	The tray on which the block is installed.
	TrayTransmissionFactor	The transmission factor of the selected tray.
	Type	The type of the block: shielding or aperture.

BrachyPlanSetup Members Eclipse Scripting API

The [BrachyPlanSetup](#) type exposes the following members.

Methods

⌵	Name	Description
	Equals	Determines whether the specified Object is equal to the current (Inherited from ApiDataObject .)
	GetCalculationModel	Returns the selected calculation model for the given calculation null if no model has been selected. (Inherited from PlanSetup .)
	GetCalculationOption	Gets the given calculation option value. (Inherited from PlanSetup .)
	GetCalculationOptions	Gets all the calculation options and their values for the given calculation model. (Inherited from PlanSetup .)
	GetDoseAtVolume	Gets the dose at a volume. (Inherited from PlanSetup .)
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data. (Inherited from PlanningItem .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVolumeAtDose	Gets the volume at a dose. (Inherited from PlanSetup .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides PlanSetup ⌵ WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

⌵	Name	Description
	ApplicationSetupType	The application setup type of this brachytherapy plan. Possible types are: "FLETCHER_SUIT", "DELCLOS", "BLOEDORN", "JOSLIN_FLYNN", "CHANDIGARH", "MANCHESTER", "HENSCHKE", "NASOPHARYNGEAL", "OESOPHAGEAL", "ENDOBONCHIAL", "SYED_NEBLETT", "ENDORECTAL", "PERINEAL", "HAM_FLAB", "EYE_PLAQUE", and "OTHER".
	ApprovalStatus	The approval status. (Inherited from PlanSetup .)

Â	Name	Description
	<u>Beams</u>	A collection of all the beams in the plan (including setup beams). Returns an empty collection if not applicable for the plan, for example, if the plan is a brachytherapy plan. (Inherited from <u>PlanSetup</u> .)
	<u>Catheters</u>	The catheters or applicator channel centerlines of this brachytherapy plan, including any catheters associated with <u>solid applicators</u> .
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Course</u>	Used for navigating to parent course. (Inherited from <u>PlanSetup</u> .)
	<u>CreationDateTime</u>	The date when this object was created. (Inherited from <u>PlanningItem</u> .)
	<u>CreationUserName</u>	The name of the user who saved the plan for the first time. (Inherited from <u>PlanSetup</u> .)
	<u>Dose</u>	The total dose. The total dose is the dose of all planned fractions together. (Inherited from <u>PlanningItem</u> .)
	<u>DoseValuePresentation</u>	The presentation of the dose as absolute or relative. (Inherited from <u>PlanningItem</u> .)
	<u>DVHEstimates</u>	Returns a list of DVH estimate objects for this plan (Inherited from <u>PlanSetup</u> .)
	<u>ElectronCalculationModel</u>	The name of the electron calculation model. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>ElectronCalculationOptions</u>	The electron calculation options. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the PlanSetup. (Inherited from <u>PlanSetup</u> .)
	<u>IsDoseValid</u>	Returns the value true if the plan dose is valid. This implies that the dose object returned from the dose property is not null and can therefore be used to query dose values. (Inherited from <u>PlanSetup</u> .)
	<u>IsTreated</u>	Checks if the treatment plan has been delivered. (Inherited from <u>PlanSetup</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)

Â	Name	Description
	<u>NumberOfPdrPulses</u>	The number of pulses in a brachytherapy Pulse Dose Rate (PDR) treatment. Null if the plan is not for a PDR treatment.
	<u>OptimizationSetup</u>	Provides access to optimization objectives and parameters. (Inherited from <u>PlanSetup</u> .)
	<u>PdrPulseInterval</u>	The pulse interval in a brachytherapy Pulse Dose Rate (PDR) treatment in seconds. Null if the plan is not for a PDR treatment.
	<u>PhotonCalculationModel</u>	The name of the photon calculation model. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>PhotonCalculationOptions</u>	The photon calculation options. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>PlanIntent</u>	The plan intent as in DICOM, or an empty string. The defined terms are "CURATIVE", "PALLIATIVE", "PROPHYLACTIC", "VERIFICATION", "MACHINE_QA", "RESEARCH" and "SERVICE", but the value can be different for imported plans. (Inherited from <u>PlanSetup</u> .)
	<u>PlanningApprovalDate</u>	The date when the plan was approved for planning. (Inherited from <u>PlanSetup</u> .)
	<u>PlanningApprover</u>	The name of the user who approved the plan for planning. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationMethod</u>	The user interface name for the current normalization method. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationPoint</u>	The plan normalization point. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationValue</u>	The plan normalization value in percentage. The plan is normalized according to the plan normalization value, for instance, 200%. The value is Double.NaN if it is not defined. Remarks
		[Requires a research license] The property setter changes also the plan normalization method to Plan Normalization Value. (Inherited from <u>PlanSetup</u> .)
	<u>PlanType</u>	The plan type. (Inherited from <u>PlanSetup</u> .)
	<u>PrescribedPercentage</u>	The prescribed dose percentage as a decimal number. For example, if the prescribed dose percentage shown in the Eclipse user interface is 80 %, returns 0.8

Â	Name	Description
		(Inherited from PlanSetup .)
	PrimaryReferencePoint	The primary reference point. (Inherited from PlanSetup .)
	ProtocolID	The protocol identifier. (Inherited from PlanSetup .)
	ProtocolPhaseID	The protocol phase identifier. (Inherited from PlanSetup .)
	ProtonCalculationModel	The name of the proton calculation model. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	ProtonCalculationOptions	The proton calculation options. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	SeedCollections	The seed collections of this brachytherapy plan.
	Series	The series that contains this plan. Null if the plan is not connected to a series. (Inherited from PlanSetup .)
	SeriesUID	The DICOM UID of the series that contains this plan. Empty string if the plan is not connected to a series. (Inherited from PlanSetup .)
	SolidApplicators	The solid applicator parts of this brachytherapy plan.
	StructureSet	The structure set. (Inherited from PlanSetup .)
	TargetVolumeID	The target volume identifier. (Inherited from PlanSetup .)
	TotalPrescribedDose	The total prescribed dose. (Inherited from PlanSetup .)
	TreatmentApprovalDate	The date when the plan was approved for treatment. (Inherited from PlanSetup .)
	TreatmentApprover	The name of the user who approved the plan for treatment. (Inherited from PlanSetup .)
	TreatmentDateTime	The treatment date of this brachytherapy plan.
	TreatmentOrientation	The orientation of the treatment. (Inherited from PlanSetup .)
	TreatmentTechnique	The treatment technique of this brachytherapy plan. Possible techniques are "INTRALUMENARY", "INTRACAVITARY", "INTERSTITIAL", "CONTACT", "INTRAVASCULAR", and "PERMANENT".
	UID	The DICOM UID of the plan. (Inherited from PlanSetup .)
	UniqueFractionation	Gets the unique fractionation. If it does not exist, an exception is thrown. (Inherited from PlanSetup .)
	VerifiedPlan	

Â	Name	Description
		Returns the verified plan if this is a verification plan, otherwise returns null. The verified plan is the clinical plan that was used to create the verification plan. (Inherited from <u>PlanSetup</u> .)

BrachyPlanSetup Methods Eclipse Scripting API

The [BrachyPlanSetup](#) type exposes the following members.

Methods

Å	Name	Description
	Equals	Determines whether the specified Object is equal to the current (Inherited from ApiDataObject .)
	GetCalculationModel	Returns the selected calculation model for the given calculation null if no model has been selected. (Inherited from PlanSetup .)
	GetCalculationOption	Gets the given calculation option value. (Inherited from PlanSetup .)
	GetCalculationOptions	Gets all the calculation options and their values for the given calculation model. (Inherited from PlanSetup .)
	GetDoseAtVolume	Gets the dose at a volume. (Inherited from PlanSetup .)
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data. (Inherited from PlanningItem .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVolumeAtDose	Gets the volume at a dose. (Inherited from PlanSetup .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides PlanSetup . WriteXml(XmlWriter) .)

Eclipse
Scripting
API**BrachyPlanSetup** WriteXml Method

Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see [XmlSerializer](#).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)[VB](#)[C++](#)[F#](#)[View ColorizedCopy to ClipboardPrint](#)

```
public override void WriteXml(
    XmlWriter writer
)
```

```
public override void WriteXml(
    XmlWriter writer
)
```

Parameters

writer

Type: [System.Xml.XmlWriter](#)

The System.Xml.XmlWriter stream, to which the object is serialized.

Implements

[IXmlSerializable](#) WriteXml(XmlWriter)

BrachyPlanSetup Properties Eclipse Scripting API

The [BrachyPlanSetup](#) type exposes the following members.

Properties

Ä	Name	Description
	ApplicationSetupType	The application setup type of this brachytherapy plan. Possible types are: "FLETCHER_SUIT", "DELCLOS", "BLOEDORN", "JOSLIN_FLYNN", "CHANDIGARH", "MANCHESTER", "HENSCHKE", "NASOPHARYNGEAL", "OESOPHAGEAL", "ENDOBONCHIAL", "SYED_NEBLETT", "ENDORECTAL", "PERINEAL", "HAM_FLAB", "EYE_PLAQUE", and "OTHER".
	ApprovalStatus	The approval status. (Inherited from PlanSetup .)
	Beams	A collection of all the beams in the plan (including setup beams). Returns an empty collection if not applicable for the plan, for example, if the plan is a brachytherapy plan. (Inherited from PlanSetup .)
	Catheters	The catheters or applicator channel centerlines of this brachytherapy plan, including any catheters associated with solid applicators .
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Course	Used for navigating to parent course. (Inherited from PlanSetup .)
	CreationDateTime	The date when this object was created. (Inherited from PlanningItem .)
	CreationUserName	The name of the user who saved the plan for the first time. (Inherited from PlanSetup .)
	Dose	The total dose. The total dose is the dose of all planned fractions together. (Inherited from PlanningItem .)
	DoseValuePresentation	The presentation of the dose as absolute or relative. (Inherited from PlanningItem .)
	DVHEstimates	Returns a list of DVH estimate objects for this plan (Inherited from PlanSetup .)
	ElectronCalculationModel	The name of the electron calculation model. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	ElectronCalculationOptions	The electron calculation options. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	HistoryDateTime	The date when this object was last modified.

Â	Name	Description
		(Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the PlanSetup. (Inherited from PlanSetup .)
	IsDoseValid	Returns the value true if the plan dose is valid. This implies that the dose object returned from the dose property is not null and can therefore be used to query dose values. (Inherited from PlanSetup .)
	IsTreated	Checks if the treatment plan has been delivered. (Inherited from PlanSetup .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	NumberOfPdrPulses	The number of pulses in a brachytherapy Pulse Dose Rate (PDR) treatment. Null if the plan is not for a PDR treatment.
	OptimizationSetup	Provides access to optimization objectives and parameters. (Inherited from PlanSetup .)
	PdrPulseInterval	The pulse interval in a brachytherapy Pulse Dose Rate (PDR) treatment in seconds. Null if the plan is not for a PDR treatment.
	PhotonCalculationModel	The name of the photon calculation model. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	PhotonCalculationOptions	The photon calculation options. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	PlanIntent	The plan intent as in DICOM, or an empty string. The defined terms are "CURATIVE", "PALLIATIVE", "PROPHYLACTIC", "VERIFICATION", "MACHINE_QA", "RESEARCH" and "SERVICE", but the value can be different for imported plans. (Inherited from PlanSetup .)
	PlanningApprovalDate	The date when the plan was approved for planning. (Inherited from PlanSetup .)
	PlanningApprover	The name of the user who approved the plan for planning. (Inherited from PlanSetup .)
	PlanNormalizationMethod	The user interface name for the current normalization method. (Inherited from PlanSetup .)
	PlanNormalizationPoint	The plan normalization point. (Inherited from PlanSetup .)

Â	Name	Description
		The plan normalization value in percentage. The plan is normalized according to the plan normalization value, for instance, 200%. The value is Double.NaN if it is not defined.
	<u>PlanNormalizationValue</u>	Remarks
		[Requires a research license] The property setter changes also the plan normalization method to Plan Normalization Value. (Inherited from <u>PlanSetup</u> .)
	<u>PlanType</u>	The plan type. (Inherited from <u>PlanSetup</u> .)
	<u>PrescribedPercentage</u>	The prescribed dose percentage as a decimal number. For example, if the prescribed dose percentage shown in the Eclipse user interface is 80 %, returns 0.8 (Inherited from <u>PlanSetup</u> .)
	<u>PrimaryReferencePoint</u>	The primary reference point. (Inherited from <u>PlanSetup</u> .)
	<u>ProtocolID</u>	The protocol identifier. (Inherited from <u>PlanSetup</u> .)
	<u>ProtocolPhaseID</u>	The protocol phase identifier. (Inherited from <u>PlanSetup</u> .)
	<u>ProtonCalculationModel</u>	The name of the proton calculation model. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>ProtonCalculationOptions</u>	The proton calculation options. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>SeedCollections</u>	The seed collections of this brachytherapy plan.
	<u>Series</u>	The series that contains this plan. Null if the plan is not connected to a series. (Inherited from <u>PlanSetup</u> .)
	<u>SeriesUID</u>	The DICOM UID of the series that contains this plan. Empty string if the plan is not connected to a series. (Inherited from <u>PlanSetup</u> .)
	<u>SolidApplicators</u>	The solid applicator parts of this brachytherapy plan.
	<u>StructureSet</u>	The structure set. (Inherited from <u>PlanSetup</u> .)
	<u>TargetVolumeID</u>	The target volume identifier. (Inherited from <u>PlanSetup</u> .)
	<u>TotalPrescribedDose</u>	The total prescribed dose. (Inherited from <u>PlanSetup</u> .)
	<u>TreatmentApprovalDate</u>	The date when the plan was approved for treatment. (Inherited from <u>PlanSetup</u> .)
	<u>TreatmentApprover</u>	The name of the user who approved the plan for

Â	Name	Description
		treatment. (Inherited from PlanSetup .)
	TreatmentDateTime	The treatment date of this brachytherapy plan.
	TreatmentOrientation	The orientation of the treatment. (Inherited from PlanSetup .)
	TreatmentTechnique	The treatment technique of this brachytherapy plan. Possible techniques are "INTRALUMENARY", "INTRACAVITARY", "INTERSTITIAL", "CONTACT", "INTRAVASCULAR", and "PERMANENT".
	UID	The DICOM UID of the plan. (Inherited from PlanSetup .)
	UniqueFractionation	Gets the unique fractionation. If it does not exist, an exception is thrown. (Inherited from PlanSetup .)
	VerifiedPlan	Returns the verified plan if this is a verification plan, otherwise returns null. The verified plan is the clinical plan that was used to create the verification plan. (Inherited from PlanSetup .)

BrachySolidApplicator Members Eclipse Scripting API

The [BrachySolidApplicator](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
Properties

Ã	Name	Description
	ApplicatorSetName	The name of the solid applicator set to which this part belongs.
	ApplicatorSetType	The type of the solid applicator set to which this part belongs.
	Category	The category of the solid applicator set to which this part belongs.
	Catheters	The channel(s) of this solid applicator part.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	Note	A note or short description of the solid applicator part.
	PartName	The name of the solid applicator part.
	PartNumber	The part number of the solid applicator.
	Summary	A summary of the solid applicator set to which this part belongs.
	UID	The unique identifier of the solid applicator part.

Â	Name	Description
	<u>Vendor</u>	The vendor of the solid applicator set to which this part belongs.
	<u>Version</u>	The version of the solid applicator part.

BrachyTreatmentUnit Members Eclipse Scripting API

The [BrachyTreatmentUnit](#) type exposes the following members.

Methods

⌕	Name	Description
	Equals	Determines whether the specified Object is equal to the current object. (Inherited from ApiDataObject .)
	GetActiveRadioactiveSource	Returns the active radioactive source of this treatment unit.
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)
Back to Top		
Properties		

⌕	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DoseRateMode	The dose rate mode of this treatment unit. Supported modes are "HDR", "PDR", "MDR", and "LDR".
	DwellTimeResolution	The dwell time resolution supported by this treatment unit in seconds.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	MachineInterface	The interface type for communicating with this brachytherapy treatment unit. Possible types are "GammaMed12i", "GammaMedPlus", "VariSource", "Other", and "Omnitron" (obsolete type).
	MachineModel	The model identifier for this treatment unit. Possible models are "VariSource_5", "VariSource_10", "Remote_Afterloading", "Manual_Loading", "GammaMed12i", and

Â	Name	Description
		"GammaMedPlus".
	<u>MaxDwellTimePerChannel</u>	The maximum combined dwell time in a single channel in seconds.
	<u>MaxDwellTimePerPos</u>	The maximum dwell time in a single dwell position in seconds.
	<u>MaxDwellTimePerTreatment</u>	The maximum combined dwell time in all the channels during a single treatment session. The value is in seconds.
	<u>MaximumChannelLength</u>	The maximum channel length supported by this treatment unit in millimeters.
	<u>MaximumDwellPositionsPerChannel</u>	The maximum number of dwell positions per channel supported by this treatment unit.
	<u>MaximumStepSize</u>	The maximum distance between adjacent source positions in millimeters.
	<u>MinimumChannelLength</u>	The minimum channel length supported by this treatment unit in millimeters.
	<u>MinimumStepSize</u>	The minimum distance between adjacent source positions in millimeters.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>NumberOfChannels</u>	The number of channels in this treatment unit.
	<u>SourceCenterOffsetFromTip</u>	The offset distance (in millimeters) from the tip of the applicator to the center of the source at its first possible dwell position. In other words, the offset accounts for half of the active source length and encapsulation.
	<u>SourceMovementType</u>	The source movement type as defined in DICOM. Possible types are "STEPWISE", "FIXED", and "OSCILLATING".
	<u>StepSizeResolution</u>	The default step size resolution for this treatment unit in millimeters.

Catheter Class Eclipse Scripting API

Represents a brachytherapy catheter or an applicator channel centerline. Catheters are associated with a brachytherapy treatment unit, a channel number, and possibly a unique identifier of the solid applicator part they belong to. Most notably, catheters encapsulate the shape of the applicator channel centerline and its source positions.

Catheter Members Eclipse Scripting API

The Catheter type exposes the following members.

Methods

Ã	Name	Description
	<u>Equals</u>	Determines whether the specified Object is equal to this Object. (Inherited from <u>ApiDataObject</u> .)
	<u>GetHashCode</u>	Serves as a hash function for this type. (Inherited from <u>ApiDataObject</u> .)
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>GetSourcePosCenterDistanceFromTip</u>	The distance (in millimeters) from the tip of the catheter (source position) to the center of the source position. The actual catheter inner lumen tip by half of the source encapsulation.
	<u>GetTotalDwellTime</u>	The total dwell time in this catheter in seconds.
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>ApiDataObject</u> .)
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>X</u> . (Overrides <u>ApiDataObject</u> . <u>WriteXml(XmlWriter)</u> .)

[Back to Top](#)

Properties

Ã	Name	Description
	<u>ApplicatorLength</u>	The total length from the tip of the catheter to the treatment unit in millimeters.
	<u>BrachySolidApplicatorPartID</u>	The unique identifier of the <u>brachytherapy solid applicator</u> part associated with the channel.
	<u>ChannelNumber</u>	The channel number of this catheter.
	<u>Color</u>	The color of the catheter in 2D views.
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Shape</u>	

Â	Name	Description
		The DICOM coordinates of the applicator shape starting from the tip.
	<u>SourcePositions</u>	The source positions in the catheter starting from the tip.
	<u>StepSize</u>	The step size of the catheter in millimeters.
	<u>TreatmentUnit</u>	The brachytherapy treatment unit associated with this catheter.

ControlPoint Class Eclipse Scripting API

Represents a point in a planned sequence of treatment beam parameters. See the definition of control points in a DICOM RT Beam.

Inheritance Hierarchy

System.Object

↳ VMS.TPS.Common.Model.API.SerializableObject

↳ ↳ VMS.TPS.Common.Model.API.ControlPoint

Namespace: VMS.TPS.Common.Model.API

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

[View ColorizedCopy to ClipboardPrint](#)

```
public class ControlPoint : SerializableObject
```

```
public class ControlPoint : SerializableObject
```

Remarks

Control points are discussed in DICOM PS 3.3 C.8.8.14. All beams have at least two control points. Note that some values may be NaN if they are not applicable to the treatment plan in question.

ControlPoint Members Eclipse Scripting API

The [ControlPoint](#) type exposes the following members.

Methods

Â	Name	Description
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides SerializableObject Â WriteXml(XmlWriter).)

[Back to Top](#)

Properties

Â	Name	Description
	CollimatorAngle	The orientation of the IEC BEAM LIMITING DEVICE coordinate system with respect to the IEC GANTRY coordinate system (in degrees).
	GantryAngle	The gantry angle of the radiation source. In other words, the orientation of the IEC GANTRY coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).
	JawPositions	The positions of the beam collimator jaws (in mm) in the IEC BEAM LIMITING DEVICE coordinates.
	LeafPositions	The positions of the beam collimator leaf pairs (in mm) in the IEC BEAMLIMITING DEVICE coordinate axis appropriate to the device type. For example, the X-axis for MLCX and the Y-axis for MLCY. The two-dimensional array is indexed [bank, leaf] where the bank is either 0 or 1. Bank 0 represents the leaf bank to the negative MLC X direction, and bank 1 to the positive MLC X direction. If there is no MLC, a (0,0)-length array is returned.
	MetersetWeight	The cumulative meterset weight to this control point. The cumulative meterset weight for the first item in a control point sequence is zero.
	PatientSupportAngle	The patient support angle. In other words, the orientation of the IEC PATIENT SUPPORT (turntable) coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).
	TableTopLateralPosition	Table top lateral position in millimeters, in the IEC TABLE TOP coordinate system.
	TableTopLongitudinalPosition	Table top longitudinal position in millimeters, in the

Â	Name	Description
		IEC TABLE TOP coordinate system.
	<u>TableTopVerticalPosition</u>	Table top vertical position in millimeters, in the IEC TABLE TOP coordinate system.

API

Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see [XmlSerializer](#).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax[C#](#)[VB](#)[C++](#)[F#](#)[View ColorizedCopy to ClipboardPrint](#)

```
public override void WriteXml(
    XmlWriter writer
)
```

```
public override void WriteXml(
    XmlWriter writer
)
```

Parameters

writer

Type: [System.Xml.XmlWriter](#)

The System.Xml.XmlWriter stream, to which the object is serialized.

Implements

[IXmlSerializable WriteXml\(XmlWriter\)](#)

See Also

»

ControlPoint Properties Eclipse Scripting API

The [ControlPoint](#) type exposes the following members.

Properties

Ä	Name	Description
	CollimatorAngle	The orientation of the IEC BEAM LIMITING DEVICE coordinate system with respect to the IEC GANTRY coordinate system (in degrees).
	GantryAngle	The gantry angle of the radiation source. In other words, the orientation of the IEC GANTRY coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).
	JawPositions	The positions of the beam collimator jaws (in mm) in the IEC BEAM LIMITING DEVICE coordinates.
	LeafPositions	The positions of the beam collimator leaf pairs (in mm) in the IEC BEAMLIMITING DEVICE coordinate axis appropriate to the device type. For example, the X-axis for MLCX and the Y-axis for MLCY. The two-dimensional array is indexed [bank, leaf] where the bank is either 0 or 1. Bank 0 represents the leaf bank to the negative MLC X direction, and bank 1 to the positive MLC X direction. If there is no MLC, a (0,0)-length array is returned.
	MetersetWeight	The cumulative meterset weight to this control point. The cumulative meterset weight for the first item in a control point sequence is zero.
	PatientSupportAngle	The patient support angle. In other words, the orientation of the IEC PATIENT SUPPORT (turntable) coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).
	TableTopLateralPosition	Table top lateral position in millimeters, in the IEC TABLE TOP coordinate system.
	TableTopLongitudinalPosition	Table top longitudinal position in millimeters, in the IEC TABLE TOP coordinate system.
	TableTopVerticalPosition	Table top vertical position in millimeters, in the IEC TABLE TOP coordinate system.

Scripting
API

ControlPoint CollimatorAngle Property

The orientation of the IEC BEAM LIMITING DEVICE coordinate system with respect to the IEC GANTRY coordinate system (in degrees).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double CollimatorAngle { get; }
```

```
public double CollimatorAngle { get; }
```

Property Value

Type: [Double](#)

Remarks

The definition is adapted from DICOM PS 3.3 C.8.8.14 "Beam Limiting Device Angle", but rotation direction is not specified explicitly.

See Also

ControlPoint.GantryAngle Property

Eclipse
Scripting
API

The gantry angle of the radiation source. In other words, the orientation of the IEC GANTRY coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double GantryAngle { get; }
```

```
public double GantryAngle { get; }
```

Property Value

Type: [Double](#)

Remarks

The definition is from DICOM PS 3.3 C.8.8.14 "Gantry Angle", but rotation direction does not change during treatment and it is specified in Beam.GantryDirection instead. See Also

»

ControlPoint.JawPositions Property

Eclipse
Scripting
API

The positions of the beam collimator jaws (in mm) in the IEC BEAM LIMITING DEVICE coordinates.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public VRect<double> JawPositions { get; }
```

```
public VRect<double> JawPositions { get; }
```

Property Value

Type: [VRect](#) [Double](#)

Remarks

The definition is adapted from DICOM PS 3.3 C.8.8.14 "Leaf/Jaw Positions". The difference is that DICOM likens the collimator jaw positions with MLC leaf positions and places them in the same sequence.

Eclipse
Scripting
API**ControlPoint. LeafPositions Property**

The positions of the beam collimator leaf pairs (in mm) in the IEC BEAMLIMITING DEVICE coordinate axis appropriate to the device type. For example, the X-axis for MLCX and the Y-axis for MLCY. The two-dimensional array is indexed [bank, leaf] where the bank is either 0 or 1. Bank 0 represents the leaf bank to the negative MLC X direction, and bank 1 to the positive MLC X direction. If there is no MLC, a (0,0)-length array is returned.

Namespace: VMS.TPS.Common.Model.API

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public float[,] LeafPositions { get; }
```

```
public float[,] LeafPositions { get; }
```

Property Value

Type: Single

Remarks

The definition is adapted from DICOM PS 3.3 C.8.8.14 "Leaf/Jaw Positions". The difference is that DICOM supports a position sequence for each collimator type while we support a position sequence for a single MLC plus four jaws.

»

Eclipse
Scripting
API**ControlPoint.MetersetWeight Property**

The cumulative meterset weight to this control point. The cumulative meterset weight for the first item in a control point sequence is zero.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double MetersetWeight { get; }
```

```
public double MetersetWeight { get; }
```

Property Value

Type: [Double](#)

Remarks

The meterset at a given control point is equal to the beam meterset, multiplied by the cumulative meterset weight for the control point, divided by the final cumulative meterset weight. The definition is adapted from DICOM PS 3.3 C.8.8.14.

ControlPoint PatientSupportAngle Property

Eclipse
Scripting
API

The patient support angle. In other words, the orientation of the IEC PATIENT SUPPORT (turntable) coordinate system with respect to the IEC FIXED REFERENCE coordinate system (in degrees).

Namespace: VMS.TPS.Common.Model.API

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public double PatientSupportAngle { get; }
```

```
public double PatientSupportAngle { get; }
```

Property Value

Type: Double

Remarks

The definition is from DICOM PS 3.3 C.8.8.14 "Patient Support Angle", but here rotation direction is specified implicitly towards the shortest angle between the current and the next control point.

Course Members Eclipse Scripting API

The [Course](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Ã	Name	Description
	BrachyPlanSetups	A collection of brachytherapy plans for the course.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CompletedDateTime	The date and time when the course was completed.
	Diagnoses	The diagnoses that are attached to the course.
	ExternalPlanSetups	A collection of external beam plans for the course.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the Course.
	Intent	The intent of the course.
	Name	The name of the object. (Inherited from ApiDataObject .)
	Patient	Patient in which the course is defined.
	PlanSetups	A collection of plans for the course. The plans can be of any type; external or brachy.
	PlanSums	A collection of plan sums for the course.
	StartDateTime	The date and time when the course was started.

Diagnosis Members Eclipse Scripting API

The Diagnosis type exposes the following members.

Methods

Ã	Name	Description
	<u>Equals</u>	Determines whether the specified Object is equal to the current Object. (Inherited from <u>ApiDataObject</u> .)
	<u>GetHashCode</u>	Serves as a hash function for this type. (Inherited from <u>ApiDataObject</u> .)
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>ApiDataObject</u> .)
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>XmlSerializer</u> . (Overrides <u>ApiDataObject</u> . <u>WriteXml(XmlWriter)</u> .)

[Back to Top](#)
Properties

Ã	Name	Description
	<u>ClinicalDescription</u>	User-defined clinical description of the diagnosis.
	<u>Code</u>	The disease code from the specified code table.
	<u>CodeTable</u>	Identifies the coding system table, for example, ICD-9-CM.
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)

Dose Members Eclipse Scripting API

The [Dose](#) type exposes the following members.

Methods

⌵	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetDoseProfile	Gets the dose profile.
	GetDoseToPoint	Gets the point dose at a specified location.
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVoxels	Gets the voxels of the given dose plane.
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	VoxelToDoseValue	Converts the given raw voxel value to the corresponding dose value.
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

⌵	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DoseMax3D	The maximum dose.
	DoseMax3DLocation	The location of the maximum dose.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Isodoses	A collection of isodoses.
	Name	The name of the object. (Inherited from ApiDataObject .)
	Origin	The origin of the dose matrix. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first dose plane.
	Series	Returns the series that contains the dose, or null if the dose is not connected to a series.

Â	Name	Description
	<u>SeriesUID</u>	Returns the DICOM UID of the series that contains the dose, or an empty string if the dose is not connected to a series.
	<u>UID</u>	The DICOM UID of the dose.
	<u>XDirection</u>	The direction of the x-axis in the dose matrix.
	<u>XRes</u>	The dose matrix resolution in X-direction in millimeters.
	<u>XSize</u>	The dose matrix size in X-direction in voxels.
	<u>YDirection</u>	The direction of the y-axis in the dose matrix.
	<u>YRes</u>	The dose matrix resolution in Y-direction in millimeters.
	<u>YSize</u>	The dose matrix size in Y-direction in voxels.
	<u>ZDirection</u>	The direction of the z-axis in the dose matrix.
	<u>ZRes</u>	The dose matrix resolution in Z-direction in millimeters.
	<u>ZSize</u>	The dose matrix size in Z-direction in voxels.

Dose GetDoseProfile MethodEclipse
Scripting
API

Gets the dose profile.

Namespace: VMS.TPS.Common.Model.API**Assembly:** VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```

public DoseProfile GetDoseProfile(
    VVector start,
    VVector stop,
    double[] preallocatedBuffer
)

public DoseProfile GetDoseProfile(
    VVector start,
    VVector stop,
    double[] preallocatedBuffer
)

```

Parameters

start

Type: VMS.TPS.Common.Model.Types.VVector
 Location of the first point of the profile.

stop

Type: VMS.TPS.Common.Model.Types.VVector
 Location of the last point of the profile.

preallocatedBuffer

Type: System.Double
 Preallocated buffer where the values are stored. The size of the buffer determines the number of values to return.

Return ValueType: DoseProfile

The DoseProfile object holding the dose values along the line segment defined by start and stop parameters.

public void GetVoxels(
    int planeIndex,
    int[,] preallocatedBuffer
)

```

Parameters

planeIndex

Type: System.Int32

Zero based index of the plane.

preallocatedBuffer

Type: System.Int32

Preallocated buffer where the voxel values are stored. The size of the buffer must conform with the X- and Y-size of this dose.

DVHData Members Eclipse Scripting API

The [DVHData](#) type exposes the following members.

Methods

Ã	Name	Description
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides SerializableObject Ã WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

Ã	Name	Description
	Coverage	The dose coverage of the target, normalized to 0.0 .. 1.0.
	CurveData	The points of the Dose Volume Histogram (DVH) curve.
	MaxDose	The maximum dose.
	MeanDose	The mean dose.
	MedianDose	The median dose.
	MinDose	The minimum dose.
	SamplingCoverage	The sampling coverage.
	StdDev	The standard deviation.
	Volume	The volume of the structure in cubic centimeters.

DynamicWedge Members Eclipse Scripting API

The [DynamicWedge](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides WedgeÃ WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CreationDateTime	The date when this object was created. (Inherited from AddOn .)
	Direction	The wedge orientation with respect to the beam orientation, in degrees. (Inherited from Wedge .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	WedgeAngle	The wedge angle. (Inherited from Wedge .)

Eclipse
Scripting
API**EnhancedDynamicWedge** WriteXml Method

Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see [XmlSerializer](#).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)[VB](#)[C++](#)[F#](#)[View ColorizedCopy to ClipboardPrint](#)

```
public override void WriteXml(
    XmlWriter writer
)
```

```
public override void WriteXml(
    XmlWriter writer
)
```

Parameters

writer

Type: [System.Xml.XmlWriter](#)

The System.Xml.XmlWriter stream, to which the object is serialized.

Implements

[IXmlSerializable](#) WriteXml(XmlWriter)

ExternalPlanSetup Members Eclipse Scripting API

The [ExternalPlanSetup](#) type exposes the following members.

Methods

⌵	Name	Description
	Equals	Determines whether the specified Object is equal to the current object. (Inherited from ApiDataObject .)
	GetCalculationModel	Returns the selected calculation model for the given calculation model. null if no model has been selected. (Inherited from PlanSetup .)
	GetCalculationOption	Gets the given calculation option value. (Inherited from PlanSetup .)
	GetCalculationOptions	Gets all the calculation options and their values for the given calculation model. (Inherited from PlanSetup .)
	GetDoseAtVolume	Gets the dose at a volume. (Inherited from PlanSetup .)
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data. (Inherited from PlanningItem .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetModelsForCalculationType	Returns a list of calculation models for the given calculation model.
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVolumeAtDose	Gets the volume at a dose. (Inherited from PlanSetup .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides PlanSetup ⌵ WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

⌵	Name	Description
	ApprovalStatus	The approval status. (Inherited from PlanSetup .)
	Beams	A collection of all the beams in the plan (including setup beams). Returns an empty collection if not applicable for the plan, for example, if the plan is a brachytherapy plan. (Inherited from PlanSetup .)
	Comment	A comment about the object.

Â	Name	Description
		(Inherited from ApiDataObject .)
	Course	Used for navigating to parent course. (Inherited from PlanSetup .)
	CreationDateTime	The date when this object was created. (Inherited from PlanningItem .)
	CreationUserName	The name of the user who saved the plan for the first time. (Inherited from PlanSetup .)
	Dose	The total dose. The total dose is the dose of all planned fractions together. (Inherited from PlanningItem .)
	DoseValuePresentation	The presentation of the dose as absolute or relative. (Inherited from PlanningItem .)
	DVHEstimates	Returns a list of DVH estimate objects for this plan (Inherited from PlanSetup .)
	ElectronCalculationModel	The name of the electron calculation model. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	ElectronCalculationOptions	The electron calculation options. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the PlanSetup. (Inherited from PlanSetup .)
	IsDoseValid	Returns the value true if the plan dose is valid. This implies that the dose object returned from the dose property is not null and can therefore be used to query dose values. (Inherited from PlanSetup .)
	IsTreated	Checks if the treatment plan has been delivered. (Inherited from PlanSetup .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	OptimizationSetup	Provides access to optimization objectives and parameters. (Inherited from PlanSetup .)
	PhotonCalculationModel	The name of the photon calculation model. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)
	PhotonCalculationOptions	The photon calculation options. Not applicable to brachytherapy plans. (Inherited from PlanSetup .)

Â	Name	Description
	<u>PlanIntent</u>	The plan intent as in DICOM, or an empty string. The defined terms are "CURATIVE", "PALLIATIVE", "PROPHYLACTIC", "VERIFICATION", "MACHINE_QA", "RESEARCH" and "SERVICE", but the value can be different for imported plans. (Inherited from <u>PlanSetup</u> .)
	<u>PlanningApprovalDate</u>	The date when the plan was approved for planning. (Inherited from <u>PlanSetup</u> .)
	<u>PlanningApprover</u>	The name of the user who approved the plan for planning. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationMethod</u>	The user interface name for the current normalization method. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationPoint</u>	The plan normalization point. (Inherited from <u>PlanSetup</u> .)
	<u>PlanNormalizationValue</u>	The plan normalization value in percentage. The plan is normalized according to the plan normalization value, for instance, 200%. The value is Double.NaN if it is not defined. Remarks
		[Requires a research license] The property setter changes also the plan normalization method to Plan Normalization Value. (Inherited from <u>PlanSetup</u> .)
	<u>PlanType</u>	The plan type. (Inherited from <u>PlanSetup</u> .)
	<u>PrescribedPercentage</u>	The prescribed dose percentage as a decimal number. For example, if the prescribed dose percentage shown in the Eclipse user interface is 80 %, returns 0.8 (Inherited from <u>PlanSetup</u> .)
	<u>PrimaryReferencePoint</u>	The primary reference point. (Inherited from <u>PlanSetup</u> .)
	<u>ProtocolID</u>	The protocol identifier. (Inherited from <u>PlanSetup</u> .)
	<u>ProtocolPhaseID</u>	The protocol phase identifier. (Inherited from <u>PlanSetup</u> .)
	<u>ProtonCalculationModel</u>	The name of the proton calculation model. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>ProtonCalculationOptions</u>	The proton calculation options. Not applicable to brachytherapy plans. (Inherited from <u>PlanSetup</u> .)
	<u>Series</u>	The series that contains this plan. Null if the plan is not connected to a series.

Â	Name	Description
		(Inherited from PlanSetup .)
	SeriesUID	The DICOM UID of the series that contains this plan. Empty string if the plan is not connected to a series. (Inherited from PlanSetup .)
	StructureSet	The structure set. (Inherited from PlanSetup .)
	TargetVolumeID	The target volume identifier. (Inherited from PlanSetup .)
	TotalPrescribedDose	The total prescribed dose. (Inherited from PlanSetup .)
	TreatmentApprovalDate	The date when the plan was approved for treatment. (Inherited from PlanSetup .)
	TreatmentApprover	The name of the user who approved the plan for treatment. (Inherited from PlanSetup .)
	TreatmentOrientation	The orientation of the treatment. (Inherited from PlanSetup .)
	UID	The DICOM UID of the plan. (Inherited from PlanSetup .)
	UniqueFractionation	Gets the unique fractionation. If it does not exist, an exception is thrown. (Inherited from PlanSetup .)
	VerifiedPlan	Returns the verified plan if this is a verification plan, otherwise returns null. The verified plan is the clinical plan that was used to create the verification plan. (Inherited from PlanSetup .)

API

FieldReferencePoint.IsFieldDoseNominal Property

Checks if the field dose is nominal (the real calculated field dose is not known). If the field doses at a reference point are nominal, they alone cannot be used to verify MU calculation.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

Fractionation Members Eclipse Scripting API

The [Fractionation](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CreationDateTime	The date when this object was created.
	DosePerFractionInPrimaryRefPoint	The calculated fraction dose in the primary reference point.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	NumberOfFractions	The number of fractions.
	PrescribedDosePerFraction	The prescribed fraction dose.

Image Members Eclipse Scripting API

The Image type exposes the following members.

Methods

Ã	Name	Description
	<u>DicomToUser</u>	Converts DICOM coordinates to the planning coordinate system used by the Eclipse user interface.
	<u>Equals</u>	Determines whether the specified Object is equal to the current Object. (Inherited from <u>ApiDataObject</u> .)
	<u>GetHashCode</u>	Serves as a hash function for this type. (Inherited from <u>ApiDataObject</u> .)
	<u>GetImageProfile</u>	Gets the image profile.
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>GetVoxels</u>	Gets the voxels of the given image plane.
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>ApiDataObject</u> .)
	<u>UserToDicom</u>	Converts a coordinate value from the planning coordinate system used by the Eclipse user interface to DICOM coordinates.
	<u>VoxelToDisplayValue</u>	Converts the given raw voxel value to the corresponding value in the user interface display unit, for example, HU, Bq/ml.
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>XmlSerializer</u> . (Overrides <u>ApiDataObject</u> . <u>WriteXml(XmlWriter)</u> .)

[Back to Top](#)

[Properties](#)

Ã	Name	Description
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>ContrastBolusAgentIngredientName</u>	The name of the contrast bolus agent ingredient that is used in the image. If the value has not been specified, returns null.
	<u>CreationDateTime</u>	The date when this object was created.
	<u>DisplayUnit</u>	The name of the display unit in which the voxels of the image are shown in the user interface.
	<u>FOR</u>	The UID of the frame of reference.
	<u>HasUserOrigin</u>	Defines if a user origin has been specified for the image.
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	

Â	Name	Description
		The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	ImagingOrientation	The orientation of the patient.
	IsProcessed	Returns the value true if an image processing filter is in use for the image.
	Level	The level setting. The value is given in the internal voxel scale.
	Name	The name of the object. (Inherited from ApiDataObject .)
	Origin	The origin of the image. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first image plane. Supported only for volume images. For other types of images, the return value is a vector of Double.NaN.
	Series	Used for navigating to parent series.
	UserOrigin	The user origin in DICOM coordinates.
	UserOriginComments	The text typed on the Origin tab in the Image Properties dialog box.
	Window	The window setting. The value is given in the internal voxel scale.
	XDirection	The direction of the x-axis in the image. Supported only for volume images. For other types of images, the return value is a vector of Double.NaN.
	XRes	The image resolution in X-direction in millimeters.
	XSize	The image size in X-direction in voxels.
	YDirection	The direction of the y-axis in the image. Supported only for volume images. For other types of images, the return value is a vector of Double.NaN.
	YRes	The image resolution in Y-direction in millimeters.
	YSize	The image size in Y-direction in voxels.
	ZDirection	The direction of the z-axis in the image. Supported only for volume images. For other types of images, the return value is a vector of Double.NaN.
	ZRes	The image resolution in Z-direction in millimeters.
	ZSize	The image size in Z-direction in voxels.

Image Methods Eclipse Scripting API

The Image type exposes the following members.

Methods

Ã	Name	Description
	<u>DicomToUser</u>	Converts DICOM coordinates to the planning coordinate system used by the Eclipse user interface.
	<u>Equals</u>	Determines whether the specified Object is equal to the current Object. (Inherited from <u>ApiDataObject</u> .)
	<u>GetHashCode</u>	Serves as a hash function for this type. (Inherited from <u>ApiDataObject</u> .)
	<u>GetImageProfile</u>	Gets the image profile.
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>GetVoxels</u>	Gets the voxels of the given image plane.
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>ApiDataObject</u> .)
	<u>UserToDicom</u>	Converts a coordinate value from the planning coordinate system used by the Eclipse user interface to DICOM coordinates.
	<u>VoxelToDisplayValue</u>	Converts the given raw voxel value to the corresponding value in the Eclipse user interface display unit, for example, HU, Bq/ml.
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>XmlSerializer</u> . (Overrides <u>ApiDataObject</u> . <u>WriteXml(XmlWriter)</u> .)

Image DicomToUser MethodEclipse
Scripting
API

Converts DICOM coordinates to the planning coordinate system used in the Eclipse user interface.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

SyntaxC#

VB

C++

F#

[View ColorizedCopy to ClipboardPrint](#)

```
public VVector DicomToUser(
    VVector dicom,
    PlanSetup planSetup
)
```

```
public VVector DicomToUser(
    VVector dicom,
    PlanSetup planSetup
)
```

Parameters

dicom

Type: [VMS.TPS.Common.Model.Types.VVector](#)
Coordinate value in DICOM coordinate system.

planSetup

Type: [VMS.TPS.Common.Model.API.PlanSetup](#)
Plan that defines the planning orientation or null.

Return ValueType: [VVector](#)

The coordinate value in the planning coordinate system used in Eclipse user interface.

Image GetImageProfile Method

Eclipse
Scripting
API

Gets the image profile.

Namespace: VMS.TPS.Common.Model.API**Assembly:** VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public ImageProfile GetImageProfile(
    VVector start,
    VVector stop,
    double[] preallocatedBuffer
)
```

```
public ImageProfile GetImageProfile(
    VVector start,
    VVector stop,
    double[] preallocatedBuffer
)
```

Parameters

start

Type: VMS.TPS.Common.Model.Types VVector
 Location of the first point of the profile.

stop

Type: VMS.TPS.Common.Model.Types VVector
 Location of the last point of the profile.

preallocatedBuffer

Type: System Double

Preallocated buffer where the values are stored. The size of the buffer determines the number of values to return.

Return ValueType: ImageProfile

The ImageProfile object holding the image pixel values along the line segment defined by start and stop parameters.

Image GetVoxels MethodEclipse
Scripting
API

Gets the voxels of the given image plane.

Namespace: VMS.TPS.Common.Model.API**Assembly:** VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```

public void GetVoxels(
    int planeIndex,
    int[,] preallocatedBuffer
)

public void GetVoxels(
    int planeIndex,
    int[,] preallocatedBuffer
)

```

Parameters

planeIndex

Type: System.Int32

Zero based index of the plane.

preallocatedBuffer

Type: System.Int32

Preallocated buffer where the voxel values are stored. The size of the buffer must conform with the X- and Y-size of this image.

Image UserToDicom Method

Eclipse
Scripting
API

Converts a coordinate value from the planning coordinate system used in the Eclipse user interface to DICOM coordinates.

Namespace: VMS.TPS.Common.Model.API

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public VVector UserToDicom(
    VVector user,
    PlanSetup planSetup
)
```

```
public VVector UserToDicom(
    VVector user,
    PlanSetup planSetup
)
```

Parameters

user

Type: VMS.TPS.Common.Model.Types.VVector
Coordinate value in the planning coordinate system.

planSetup

Type: VMS.TPS.Common.Model.API.PlanSetup
Plan that defines the planning orientation or null.

Return Value

Type: VVector

The coordinate value in DICOM coordinate system.

Image Properties Eclipse Scripting API

The Image type exposes the following members.

Properties

Ä	Name	Description
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>ContrastBolusAgentIngredientName</u>	The name of the contrast bolus agent ingredient that is used in the image. If the value has not been specified, returns null.
	<u>CreationDateTime</u>	The date when this object was created.
	<u>DisplayUnit</u>	The name of the display unit in which the voxels of the image are shown in the user interface.
	<u>FOR</u>	The UID of the frame of reference.
	<u>HasUserOrigin</u>	Defines if a user origin has been specified for the image.
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>ImagingOrientation</u>	The orientation of the patient.
	<u>IsProcessed</u>	Returns the value true if an image processing filter is in use for the image.
	<u>Level</u>	The level setting. The value is given in the internal voxel scale.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Origin</u>	The origin of the image. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first image plane. Supported only for volume images. For other types of images, the return value is a vector of Double.NaN.
	<u>Series</u>	Used for navigating to parent series.
	<u>UserOrigin</u>	The user origin in DICOM coordinates.
	<u>UserOriginComments</u>	The text typed on the Origin tab in the Image Properties dialog box.
	<u>Window</u>	The window setting. The value is given in the internal voxel scale.
	<u>XDirection</u>	The direction of the x-axis in the image. Supported only for volume images. For other

Â	Name	Description
		types of images, the return value is a vector of Double.NaNs.
	<u>XRes</u>	The image resolution in X-direction in millimeters.
	<u>XSize</u>	The image size in X-direction in voxels.
	<u>YDirection</u>	The direction of the y-axis in the image. Supported only for volume images. For other types of images, the return value is a vector of Double.NaNs.
	<u>YRes</u>	The image resolution in Y-direction in millimeters.
	<u>YSize</u>	The image size in Y-direction in voxels.
	<u>ZDirection</u>	The direction of the z-axis in the image. Supported only for volume images. For other types of images, the return value is a vector of Double.NaNs.
	<u>ZRes</u>	The image resolution in Z-direction in millimeters.
	<u>ZSize</u>	The image size in Z-direction in voxels.

OmniWedge Properties Eclipse Scripting API

The OmniWedge type exposes the following members.

Properties

Ã	Name	Description
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>CreationDateTime</u>	The date when this object was created. (Inherited from <u>AddOn</u> .)
	<u>Direction</u>	The wedge orientation with respect to the beam orientation, in degrees. (Inherited from <u>Wedge</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>WedgeAngle</u>	The wedge angle. (Inherited from <u>Wedge</u> .)

OptimizationEUDObjective Class Eclipse Scripting API

A gEUD objective is an exact, upper or lower objective. An exact gEUD objective defines an exact dose value that a target structure should receive. An upper gEUD objective defines the maximum dose value that a structure should receive. A lower gEUD objective defines the minimum dose value that a target structure should receive. Generalized Equivalent Uniform Dose (gEUD) is a uniform dose that, if delivered over the same number of fractions, yields the same radiobiological effect as the non-uniform dose distribution of interest.

OptimizationNormalTissueParameter Members Eclipse Scripting API

The [OptimizationNormalTissueParameter](#) type exposes the following members.
Methods

Â	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from OptimizationParameter .)
	GetHashCode	Serves as a hash function for a particular type. (Inherited from OptimizationParameter .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides OptimizationParameter Â WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Â	Name	Description
	DistanceFromTargetBorderInMM	Determines the distance in millimeters from the target border where the evaluation of the normal tissue objective dose begins.
	EndDosePercentage	Determines the relative dose level in the normal tissue objective in the area furthest from the target border. Expressed in percentage. The value is positive. 100% is specified as 100.
	FallOff	Determines the steepness of the normal tissue objective fall-off. The value is positive.
	IsAutomatic	Returns True if an automatic normal tissue objective (NTO) is used. The automatic NTO adapts to the patient anatomy and the optimization objectives, and automatically determines the dose fall-off criteria. When an automatic NTO is used, the other properties of this object, except Priority, are not used.
	Priority	Determines the relative importance of the normal tissue objective in relation to other optimization objectives. The value is positive.
	StartDosePercentage	Determines the relative dose level in the normal tissue objective at the target border, expressed in percentage of the upper objective for the target. The value is positive. 100% is specified as 100.

OptimizationObjective Members Eclipse Scripting API

The [OptimizationObjective](#) type exposes the following members.

Methods

Â	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Overrides ObjectÂ Equals(Object).)
	GetHashCode	Serves as a hash function for a particular type. (Overrides ObjectÂ GetHashCodeÂ .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject.)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject.)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides SerializableObjectÂ WriteXml(XmlWriter).)

[Back to Top](#)

Operators

Â	Name	Description
	Equality	The equality operator.
	Inequality	The inequality operator.

[Back to Top](#)

Properties

Â	Name	Description
	Structure	The structure to which this optimization objective belongs.
	StructureId	The identifier of the structure.

OptimizationObjective Equals Method

Eclipse
Scripting
API

Determines whether the specified object is equal to the current object.

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public override bool Equals(
    Object obj
)
```

```
public override bool Equals(
    Object obj
)
```

Parameters

obj

Type: [System.Object](#)

The object to compare with the current object.

Return Value

Type: [Boolean](#)

true if the specified object is equal to the current object; otherwise, false.

Scripting
API

Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see [XmlSerializer](#).

Namespace: [VMS.TPS.Common.Model.API](#)

Assembly: [VMS.TPS.Common.Model.API](#) (in [VMS.TPS.Common.Model.API.dll](#))

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

[View ColorizedCopy to ClipboardPrint](#)

```
public override void WriteXml(
    XmlWriter writer
)
```

```
public override void WriteXml(
    XmlWriter writer
)
```

Parameters

writer

Type: [System.Xml.XmlWriter](#)

The System.Xml.XmlWriter stream, to which the object is serialized.

Implements

[IXmlSerializable](#) WriteXml(XmlWriter)

OptimizationPointObjective Properties Eclipse Scripting API

The [OptimizationPointObjective](#) type exposes the following members.
Properties

Â	Name	Description
	Dose	The dose value for the objective.
	Operator	Specifies the type of the point objective.
	Priority	The priority of the objective as a positive double.
	Structure	The structure to which this optimization objective belongs. (Inherited from OptimizationObjective .)
	StructureId	The identifier of the structure. (Inherited from OptimizationObjective .)
	Volume	Percentage of the structure volume (0-100 %) to receive the dose.

Patient Members Eclipse Scripting API

The [Patient](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)
Back to Top		
Properties		

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Courses	A collection of the patient's courses.
	CreationDateTime	The date when this object was created.
	DateOfBirth	The date of birth of the patient.
	FirstName	The first name of the patient.
	HasModifiedData	Returns true if the patient object tree has been modified.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Hospital	The hospital.
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Id2	The patient ID2.
	LastName	The last name of the patient.
	MiddleName	The middle name of the patient.
	Name	The name of the object. (Inherited from ApiDataObject .)
	PrimaryOncologistId	The identifier of the primary oncologist.
	Registrations	A collection of registrations.
	Sex	The gender of the patient.

Â	Name	Description
	<u>SSN</u>	The Social Security Account Number (SSN) of the patient.
	<u>StructureSets</u>	A collection of structure sets.
	<u>Studies</u>	A collection of studies.

PatientSummary Members Eclipse Scripting API

The PatientSummary type exposes the following members.

Methods

Â	Name	Description
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>XmlSerializer</u> . (Overrides <u>SerializableObject</u> Â WriteXml(XmlWriter).)

[Back to Top](#)

Properties

Â	Name	Description
	<u>CreationDateTime</u>	The date when the patient object was created.
	<u>DateOfBirth</u>	The date of birth of the patient.
	<u>FirstName</u>	The first name of the patient.
	<u>Id</u>	The patient ID.
	<u>Id2</u>	The patient ID2.
	<u>LastName</u>	The last name of the patient.
	<u>MiddleName</u>	The middle name of the patient.
	<u>Sex</u>	The gender of the patient.
	<u>SSN</u>	The Social Security Account Number (SSN) of the patient.

PlanningItem Members Eclipse Scripting API

The [PlanningItem](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current (Inherited from ApiDataObject .)
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data.
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CreationDateTime	The date when this object was created.
	Dose	The total dose. The total dose is the dose of all planned fractions together.
	DoseValuePresentation	The presentation of the dose as absolute or relative.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)

)

public DVHData GetDVHCumulativeData(
    Structure structure,
    DoseValuePresentation dosePresentation,
    VolumePresentation volumePresentation,
    double binWidth
)

```

Parameters

structure

Type: VMS.TPS.Common.Model.API Structure
 Structure for which the DVH data is requested.

dosePresentation

Type: VMS.TPS.Common.Model.Types DoseValuePresentation
 Requested dose presentation mode (absolute or relative). Note, that only absolute dose is supported for PlanSums.

volumePresentation

Type: VMS.TPS.Common.Model.Types VolumePresentation
 Requested volume presentation mode.

binWidth

Type: System Double
 Requested width of the bin.

Return Value

Type: [DVHData](#)

DVHData object that contains the requested DVH information or null if DVH calculation was not possible.

	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>DoseMax3D</u>	The maximum dose. (Inherited from <u>Dose</u> .)
	<u>DoseMax3DLocation</u>	The location of the maximum dose. (Inherited from <u>Dose</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Isodoses</u>	A collection of isodoses. (Inherited from <u>Dose</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Origin</u>	The origin of the dose matrix. In other words, the DICOM coordinates of the center point of the upper-left hand corner voxel of the first dose plane. (Inherited from <u>Dose</u> .)
	<u>Series</u>	Returns the series that contains the dose, or null if the dose is not connected to a series. (Inherited from <u>Dose</u> .)
	<u>SeriesUID</u>	Returns the DICOM UID of the series that contains the dose, or an empty string if the dose is not connected to a series. (Inherited from <u>Dose</u> .)
	<u>UID</u>	The DICOM UID of the dose. (Inherited from <u>Dose</u> .)
	<u>XDirection</u>	The direction of the x-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>XRes</u>	The dose matrix resolution in X-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>XSize</u>	The dose matrix size in X-direction in voxels. (Inherited from <u>Dose</u> .)
	<u>YDirection</u>	The direction of the y-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>YRes</u>	The dose matrix resolution in Y-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>YSize</u>	The dose matrix size in Y-direction in voxels. (Inherited from <u>Dose</u> .)

Â	Name	Description
	<u>ZDirection</u>	The direction of the z-axis in the dose matrix. (Inherited from <u>Dose</u> .)
	<u>ZRes</u>	The dose matrix resolution in Z-direction in millimeters. (Inherited from <u>Dose</u> .)
	<u>ZSize</u>	The dose matrix size in Z-direction in voxels. (Inherited from <u>Dose</u> .)

PlanSetup Members Eclipse Scripting API

The [PlanSetup](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current (Inherited from ApiDataObject .)
	GetCalculationModel	Returns the selected calculation model for the given calculation null if no model has been selected.
	GetCalculationOption	Gets the given calculation option value.
	GetCalculationOptions	Gets all the calculation options and their values for the given calculation model.
	GetDoseAtVolume	Gets the dose at a volume.
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data. (Inherited from PlanningItem .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetVolumeAtDose	Gets the volume at a dose.
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides PlanningItem . WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Ã	Name	Description
	ApprovalStatus	The approval status.
	Beams	A collection of all the beams in the plan (including setup beams). Returns an empty collection if not applicable for the plan, for example, if the plan is a brachytherapy plan.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Course	Used for navigating to parent course.
	CreationDateTime	The date when this object was created. (Inherited from PlanningItem .)
	CreationUserName	The name of the user who saved the plan for the first time.
	Dose	The total dose. The total dose is the dose of all planned fractions together.

Â	Name	Description
		(Inherited from PlanningItem .)
	DoseValuePresentation	The presentation of the dose as absolute or relative. (Inherited from PlanningItem .)
	DVHEstimates	Returns a list of DVH estimate objects for this plan
	ElectronCalculationModel	The name of the electron calculation model. Not applicable to brachytherapy plans.
	ElectronCalculationOptions	The electron calculation options. Not applicable to brachytherapy plans.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the PlanSetup.
	IsDoseValid	Returns the value true if the plan dose is valid. This implies that the dose object returned from the dose property is not null and can therefore be used to query dose values.
	IsTreated	Checks if the treatment plan has been delivered.
	Name	The name of the object. (Inherited from ApiDataObject .)
	OptimizationSetup	Provides access to optimization objectives and parameters.
	PhotonCalculationModel	The name of the photon calculation model. Not applicable to brachytherapy plans.
	PhotonCalculationOptions	The photon calculation options. Not applicable to brachytherapy plans.
	PlanIntent	The plan intent as in DICOM, or an empty string. The defined terms are "CURATIVE", "PALLIATIVE", "PROPHYLACTIC", "VERIFICATION", "MACHINE_QA", "RESEARCH" and "SERVICE", but the value can be different for imported plans.
	PlanningApprovalDate	The date when the plan was approved for planning.
	PlanningApprover	The name of the user who approved the plan for planning.
	PlanNormalizationMethod	The user interface name for the current normalization method.
	PlanNormalizationPoint	The plan normalization point.
	PlanNormalizationValue	The plan normalization value in percentage. The plan is normalized according to the plan normalization value, for instance, 200%. The value is Double.NaN if it is not defined.
		Remarks

Ã	Name	Description
		[Requires a research license] The property setter changes also the plan normalization method to Plan Normalization Value.
	<u>PlanType</u>	The plan type.
	<u>PrescribedPercentage</u>	The prescribed dose percentage as a decimal number. For example, if the prescribed dose percentage shown in the Eclipse user interface is 80 %, returns 0.8
	<u>PrimaryReferencePoint</u>	The primary reference point.
	<u>ProtocolID</u>	The protocol identifier.
	<u>ProtocolPhaseID</u>	The protocol phase identifier.
	<u>ProtonCalculationModel</u>	The name of the proton calculation model. Not applicable to brachytherapy plans.
	<u>ProtonCalculationOptions</u>	The proton calculation options. Not applicable to brachytherapy plans.
	<u>Series</u>	The series that contains this plan. Null if the plan is not connected to a series.
	<u>SeriesUID</u>	The DICOM UID of the series that contains this plan. Empty string if the plan is not connected to a series.
	<u>StructureSet</u>	The structure set.
	<u>TargetVolumeID</u>	The target volume identifier.
	<u>TotalPrescribedDose</u>	The total prescribed dose.
	<u>TreatmentApprovalDate</u>	The date when the plan was approved for treatment.
	<u>TreatmentApprover</u>	The name of the user who approved the plan for treatment.
	<u>TreatmentOrientation</u>	The orientation of the treatment.
	<u>UID</u>	The DICOM UID of the plan.
	<u>UniqueFractionation</u>	Gets the unique fractionation. If it does not exist, an exception is thrown.
	<u>VerifiedPlan</u>	Returns the verified plan if this is a verification plan, otherwise returns null. The verified plan is the clinical plan that was used to create the verification plan.

Eclipse
Scripting
API**PlanSetup** GetCalculationOption Method

Gets the given calculation option value.

Namespace: VMS.TPS.Common.Model.API**Assembly:** VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public bool GetCalculationOption(
    string calculationModel,
    string optionName,
    out string optionValue
)
```

```
public bool GetCalculationOption(
    string calculationModel,
    string optionName,
    out string optionValue
)
```

Parameters

calculationModel

Type: System.String

The name of the calculation model.

optionName

Type: System.String

The XPath or name of the option to set.

optionValue

Type: System.String

The value of the given option.

Return ValueType: Boolean

Returns false if the method cannot find the given option.

Remarks

Available options are stored in the schema files of the calculation model located on the Distributed Calculation Framework (DCF) server.

)

public DoseValue GetDoseAtVolume(
    Structure structure,
    double volume,
    VolumePresentation volumePresentation,
    DoseValuePresentation requestedDosePresentation
)

```

Parameters

structure

Type: VMS.TPS.Common.Model.API Structure
 Structure for which the value is requested.

volume

Type: System Double
 Volume at which the dose is requested.

volumePresentation

Type: VMS.TPS.Common.Model.Types VolumePresentation
 Presentation mode of the volume parameter.

requestedDosePresentation

Type: VMS.TPS.Common.Model.Types DoseValuePresentation
 Requested dose presentation mode (absolute or relative).

Return ValueType: DoseValue

The dose value at the given volume of structure.

Return Value

PlanSetup Properties Eclipse Scripting API

The PlanSetup type exposes the following members.

Properties

Ä	Name	Description
	<u>ApprovalStatus</u>	The approval status.
	<u>Beams</u>	A collection of all the beams in the plan (including setup beams). Returns an empty collection if not applicable for the plan, for example, if the plan is a brachytherapy plan.
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Course</u>	Used for navigating to parent course.
	<u>CreationDateTime</u>	The date when this object was created. (Inherited from <u>PlanningItem</u> .)
	<u>CreationUserName</u>	The name of the user who saved the plan for the first time.
	<u>Dose</u>	The total dose. The total dose is the dose of all planned fractions together. (Inherited from <u>PlanningItem</u> .)
	<u>DoseValuePresentation</u>	The presentation of the dose as absolute or relative. (Inherited from <u>PlanningItem</u> .)
	<u>DVHEstimates</u>	Returns a list of DVH estimate objects for this plan
	<u>ElectronCalculationModel</u>	The name of the electron calculation model. Not applicable to brachytherapy plans.
	<u>ElectronCalculationOptions</u>	The electron calculation options. Not applicable to brachytherapy plans.
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the PlanSetup.
	<u>IsDoseValid</u>	Returns the value true if the plan dose is valid. This implies that the dose object returned from the dose property is not null and can therefore be used to query dose values.
	<u>IsTreated</u>	Checks if the treatment plan has been delivered.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>OptimizationSetup</u>	Provides access to optimization objectives and parameters.
	<u>PhotonCalculationModel</u>	The name of the photon calculation model. Not applicable to brachytherapy plans.
	<u>PhotonCalculationOptions</u>	

Â	Name	Description
		The photon calculation options. Not applicable to brachytherapy plans.
	<u>PlanIntent</u>	The plan intent as in DICOM, or an empty string. The defined terms are "CURATIVE", "PALLIATIVE", "PROPHYLACTIC", "VERIFICATION", "MACHINE_QA", "RESEARCH" and "SERVICE", but the value can be different for imported plans.
	<u>PlanningApprovalDate</u>	The date when the plan was approved for planning.
	<u>PlanningApprover</u>	The name of the user who approved the plan for planning.
	<u>PlanNormalizationMethod</u>	The user interface name for the current normalization method.
	<u>PlanNormalizationPoint</u>	The plan normalization point.
		The plan normalization value in percentage. The plan is normalized according to the plan normalization value, for instance, 200%. The value is Double.NaN if it is not defined.
	<u>PlanNormalizationValue</u>	Remarks
		[Requires a research license] The property setter changes also the plan normalization method to Plan Normalization Value.
	<u>PlanType</u>	The plan type.
	<u>PrescribedPercentage</u>	The prescribed dose percentage as a decimal number. For example, if the prescribed dose percentage shown in the Eclipse user interface is 80 %, returns 0.8
	<u>PrimaryReferencePoint</u>	The primary reference point.
	<u>ProtocolID</u>	The protocol identifier.
	<u>ProtocolPhaseID</u>	The protocol phase identifier.
	<u>ProtonCalculationModel</u>	The name of the proton calculation model. Not applicable to brachytherapy plans.
	<u>ProtonCalculationOptions</u>	The proton calculation options. Not applicable to brachytherapy plans.
	<u>Series</u>	The series that contains this plan. Null if the plan is not connected to a series.
	<u>SeriesUID</u>	The DICOM UID of the series that contains this plan. Empty string if the plan is not connected to a series.
	<u>StructureSet</u>	The structure set.
	<u>TargetVolumeID</u>	The target volume identifier.
	<u>TotalPrescribedDose</u>	The total prescribed dose.
	<u>TreatmentApprovalDate</u>	The date when the plan was approved for treatment.
	<u>TreatmentApprover</u>	The name of the user who approved the plan for treatment.
	<u>TreatmentOrientation</u>	The orientation of the treatment.

Å	Name	Description
	<u>UID</u>	The DICOM UID of the plan.
	<u>UniqueFractionation</u>	Gets the unique fractionation. If it does not exist, an exception is thrown.
	<u>VerifiedPlan</u>	Returns the verified plan if this is a verification plan, otherwise returns null. The verified plan is the clinical plan that was used to create the verification plan.

PlanSum Members Eclipse Scripting API

The [PlanSum](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current (Inherited from ApiDataObject .)
	GetDVHCumulativeData	Returns cumulative Dose Volume Histogram (DVH) data. (Inherited from PlanningItem .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetPlanSumOperation	Returns the summing operation of the plan in the plan sum.
	GetPlanWeight	Returns the weight of the plan included in the sum.
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information to serialize an object into an XML document, see XmlSerializer . (Overrides PlanningItem . WriteXml(XmlWriter) .)

[Back to Top](#)

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Course	Used for navigating to the parent course.
	CreationDateTime	The date when this object was created. (Inherited from PlanningItem .)
	Dose	The total dose. The total dose is the dose of all planned fractions together. (Inherited from PlanningItem .)
	DoseValuePresentation	The presentation of the dose as absolute or relative. (Inherited from PlanningItem .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	PlanSetups	A collection of plan setups.

Â	Name	Description
	<u>PlanSumComponents</u>	A collection of plans in a plan sum.
	<u>StructureSet</u>	The structure set.

PlanSum Properties Eclipse Scripting API

The [PlanSum](#) type exposes the following members.

Properties

Å	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	Course	Used for navigating to the parent course.
	CreationDateTime	The date when this object was created. (Inherited from PlanningItem .)
	Dose	The total dose. The total dose is the dose of all planned fractions together. (Inherited from PlanningItem .)
	DoseValuePresentation	The presentation of the dose as absolute or relative. (Inherited from PlanningItem .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	PlanSetups	A collection of plan setups.
	PlanSumComponents	A collection of plans in a plan sum.
	StructureSet	The structure set.

PlanSumComponent Members Eclipse Scripting API

The PlanSumComponent type exposes the following members.

Methods

Ã	Name	Description
	<u>Equals</u>	Determines whether the specified Object is equal to the current Object. (Inherited from <u>ApiDataObject</u> .)
	<u>GetHashCode</u>	Serves as a hash function for this type. (Inherited from <u>ApiDataObject</u> .)
	<u>GetSchema</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ReadXml</u>	This member is internal to the Eclipse Scripting API. (Inherited from <u>SerializableObject</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>ApiDataObject</u> .)
	<u>WriteXml</u>	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see <u>XmlSerializer</u> . (Overrides <u>ApiDataObject</u> . WriteXml(XmlWriter).)

[Back to Top](#)
Properties

Ã	Name	Description
	<u>Comment</u>	A comment about the object. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryDateTime</u>	The date when this object was last modified. (Inherited from <u>ApiDataObject</u> .)
	<u>HistoryUserName</u>	The identifier of the last user who modified this object. (Inherited from <u>ApiDataObject</u> .)
	<u>Id</u>	The identifier of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>PlanSetupId</u>	The unique identification of the plan within the course.
	<u>PlanSumOperation</u>	The summing operation (+ or -) that defines how the dose of a component plan contributes to the plan sum.
	<u>PlanWeight</u>	The weight of a component plan included in the plan sum.

RadioactiveSourceModel Members Eclipse Scripting API

The [RadioactiveSourceModel](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Ã	Name	Description
	ActiveSize	The active size of the modeled radioactive source in x, y, and z dimensions in millimeters. x represents the source width, y represents the source height, and z the source length.
	ActivityConversionFactor	The activity-kerma conversion factor is used for converting activity (in mCi) to air-kerma strength (in U = cGy cm ² / h). The unit of the factor is [U / mCi].
	CalculationModel	The dose calculation type used with this source model. Possible values are "Point source" and "Linear source".
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DoseRateConstant	A conversion factor from the air-kerma strength to the dose rate in tissue. The unit of the dose rate constant is cGy / (h U).
	HalfLife	The half life of the isotope in seconds.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	LiteratureReference	The reference to the scientific publications on which the source model is based.

Â	Name	Description
	<u>Manufacturer</u>	The manufacturer of the modeled radioactive source.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>SourceType</u>	The DICOM source type. Possible values are "Point", "Line", "Cylinder", and "Sphere".
	<u>Status</u>	The status of this source model. The status can be either "Unapproved", "Commissioning", "Approved", or "Retired".
	<u>StatusDate</u>	The time when the status of the source model was set.
	<u>StatusUserName</u>	The name of the user who last set the status of the source model.

RadioactiveSourceModel Properties Eclipse Scripting API

The [RadioactiveSourceModel](#) type exposes the following members.

Properties

Ä	Name	Description
	ActiveSize	The active size of the modeled radioactive source in x, y, and z dimensions in millimeters. x represents the source width, y represents the source height, and z the source length.
	ActivityConversionFactor	The activity-kerma conversion factor is used for converting activity (in mCi) to air-kerma strength (in U = cGy cm ² / h). The unit of the factor is [U / mCi].
	CalculationModel	The dose calculation type used with this source model. Possible values are "Point source" and "Linear source".
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DoseRateConstant	A conversion factor from the air-kerma strength to the dose rate in tissue. The unit of the dose rate constant is cGy / (h U).
	HalfLife	The half life of the isotope in seconds.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	LiteratureReference	The reference to the scientific publications on which the source model is based.
	Manufacturer	The manufacturer of the modeled radioactive source.
	Name	The name of the object. (Inherited from ApiDataObject .)
	SourceType	The DICOM source type. Possible values are "Point", "Line", "Cylinder", and "Sphere".
	Status	The status of this source model. The status can be either "Unapproved", "Commissioning", "Approved", or "Retired".
	StatusDate	The time when the status of the source model was set.
	StatusUserName	The name of the user who last set the status of the source model.

ScriptContext Members Eclipse Scripting API

The ScriptContext type exposes the following members.

Constructors

Ã	Name	Description
	<u>ScriptContext</u>	Provides scripts an access to the current data context. A context instance is given as a parameter in the Execute function of the script. The script itself does not instantiate the context.

[Back to Top](#)

Properties

Ã	Name	Description
	<u>ApplicationName</u>	The name of the active application.
	<u>BrachyPlanSetup</u>	The active brachytherapy plan setup. The value is null if the active object is not a brachytherapy plan setup.
	<u>BrachyPlansInScope</u>	Retrieves a list of all brachytherapy plans in the Scope window.
	<u>Course</u>	The course. The value may be null if the context has no course.
	<u>CurrentUser</u>	The current user of the application.
	<u>ExternalPlanSetup</u>	The active external beam plan setup. The value is null if the active object is not an external beam plan setup.
	<u>ExternalPlansInScope</u>	Retrieves a list of all external beam plans in the Scope window.
	<u>Image</u>	The 3D image. The value may be null if the context has no image.
	<u>Patient</u>	The patient. The value may be null if the context has no patient.
	<u>PlanSetup</u>	The plan setup. The value may be null if the context has no plan setup.
	<u>PlansInScope</u>	Retrieves a list of all plans in the Scope window.
	<u>PlanSumsInScope</u>	Retrieves a list of all plan sums in the Scope window.
	<u>StructureSet</u>	The structure set. The value may be null if the context has no structure set.
	<u>VersionInfo</u>	The version number of Eclipse.

SeedCollection Members Eclipse Scripting API

The [SeedCollection](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
Properties

Ã	Name	Description
	Color	The color of the seeds in the seed collection in the views.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	SourcePositions	The source positions in this collection in creation order.

SerializableObject Methods Eclipse Scripting API

The [SerializableObject](#) type exposes the following members.

Methods

Ã	Name	Description
	ClearSerializationHistory	This member is internal to the Eclipse Scripting API.
	GetSchema	This member is internal to the Eclipse Scripting API.
	ReadXml	This member is internal to the Eclipse Scripting API.
	WriteXml	Serializes this object to the given XmlWriter.

Series Members Eclipse Scripting API

The [Series](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)
Back to Top		
Properties		

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	FOR	The UID of the frame of reference.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Images	A collection of images that belong to the series.
	ImagingDeviceId	The identifier of the device that is used to scan the images into the system. Returns an empty string if the imaging device is not unique or the device identifier is not defined.
	ImagingDeviceManufacturer	The manufacturer of the device that is used to scan the images into the system. Returns an empty string if the imaging device is not unique or the device manufacturer is not defined.
	ImagingDeviceModel	The model of the device that is used to scan the images into the system. Returns an empty string if the imaging device is not unique or the device model is not defined.

Â	Name	Description
	<u>ImagingDeviceSerialNo</u>	The serial number of the device that is used to scan the images into the system. Returns an empty string if the imaging device is not unique or the device serial number is not defined.
	<u>Modality</u>	The modality of the series.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>Study</u>	Used for navigating to parent study.
	<u>UID</u>	The DICOM UID.

	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)
[Properties](#)

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DwellTime	The dwell time associated with this source position in seconds.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	RadioactiveSource	The radioactive source associated with this dwell position.
	Transform	The 4x4 transformation matrix represents the orientation and location of the source position in space. The matrix is composed of a 4x3 rotation submatrix and a 4x1 translation vector. Its bottom row indicates scaling and is always [0 0 0 1]. The translation vector indicates the coordinates of the source position center, in millimeters. The third column of the rotation matrix indicates the source axis direction.
	Translation	The translation of this source position.

SourcePosition Properties Eclipse Scripting API

The [SourcePosition](#) type exposes the following members.

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DwellTime	The dwell time associated with this source position in seconds.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	RadioactiveSource	The radioactive source associated with this dwell position.
	Transform	The 4x4 transformation matrix represents the orientation and location of the source position in space. The matrix is composed of a 4x3 rotation submatrix and a 4x1 translation vector. Its bottom row indicates scaling and is always [0 0 0 1]. The translation vector indicates the coordinates of the source position center, in millimeters. The third column of the rotation matrix indicates the source axis direction.
	Translation	The translation of this source position.

StandardWedge Members Eclipse Scripting API

The [StandardWedge](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides WedgeÃ WriteXml(XmlWriter) .)
Back to Top		
Properties		

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	CreationDateTime	The date when this object was created. (Inherited from AddOn .)
	Direction	The wedge orientation with respect to the beam orientation, in degrees. (Inherited from Wedge .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Name	The name of the object. (Inherited from ApiDataObject .)
	WedgeAngle	The wedge angle. (Inherited from Wedge .)

Methods

⌵	Name	Description
	Equals	Determines whether the specified Object is equal to the current object. (Inherited from ApiDataObject .)
	GetAssignedHU	Returns the HU value of the material.
	GetContoursOnImagePlane	If the structure has a segment, gets the contours of the structure on the image plane.
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetNumberOfSeparateParts	If the structure has a segment, returns the number of separate parts.
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	GetSegmentProfile	If the structure has a segment, gets the segment profile.
	IsPointInsideSegment	If the structure has a segment, checks if the given point lies inside the structure.
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject . WriteXml(XmlWriter) .)

[Back to Top](#)

[Properties](#)

⌵	Name	Description
	CenterPoint	The center point of the structure.
	Color	The color of the structure.
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	DicomType	The DICOM type of the structure, for example, PTV, MARKER, or ORGAN.
	HasSegment	Checks if the structure has a segment.
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the Structure.
	IsEmpty	Checks if the structure is empty.
	IsHighResolution	true if this structure is a high-resolution structure. Otherwise false.

Â	Name	Description
	<u>MeshGeometry</u>	The mesh geometry.
	<u>Name</u>	The name of the object. (Inherited from <u>ApiDataObject</u> .)
	<u>ROINumber</u>	The DICOM ROI Number of the structure.
	<u>StructureCodeInfos</u>	A collection of structure codes attached to this structure.
	<u>Volume</u>	The calculated volume.

Structure GetSegmentProfile Method

Eclipse
Scripting
API

If the structure has a segment, gets the segment profile.

Namespace: VMS.TPS.Common.Model.API

Assembly: VMS.TPS.Common.Model.API (in VMS.TPS.Common.Model.API.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public SegmentProfile GetSegmentProfile(
    VVector start,
    VVector stop,
    BitArray preallocatedBuffer
)
```

```
public SegmentProfile GetSegmentProfile(
    VVector start,
    VVector stop,
    BitArray preallocatedBuffer
)
```

Parameters

start

Type: VMS.TPS.Common.Model.Types VVector
Location of the first point of the profile.

stop

Type: VMS.TPS.Common.Model.Types VVector
Location of the last point of the profile.

preallocatedBuffer

Type: System.Collections BitArray
Preallocated buffer where the values are stored. The size of the buffer determines the number of values to return.

Return Value

Type: SegmentProfile

The SegmentProfile object holding segment values (true if inside, false otherwise) along the line segment defined by start and stop parameters.

StructureSet Members Eclipse Scripting API

The [StructureSet](#) type exposes the following members.

Methods

Ã	Name	Description
	Equals	Determines whether the specified Object is equal to the current Object. (Inherited from ApiDataObject .)
	GetHashCode	Serves as a hash function for this type. (Inherited from ApiDataObject .)
	GetSchema	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ReadXml	This member is internal to the Eclipse Scripting API. (Inherited from SerializableObject .)
	ToString	Returns a string that represents the current object. (Inherited from ApiDataObject .)
	WriteXml	Converts an object into its XML representation. For more information on how to serialize an object into an XML document, see XmlSerializer . (Overrides ApiDataObject Ã WriteXml(XmlWriter).)

[Back to Top](#)

Properties

Ã	Name	Description
	Comment	A comment about the object. (Inherited from ApiDataObject .)
	HistoryDateTime	The date when this object was last modified. (Inherited from ApiDataObject .)
	HistoryUserName	The identifier of the last user who modified this object. (Inherited from ApiDataObject .)
	Id	The identifier of the object. (Inherited from ApiDataObject .)
	Image	Used for navigating to the image.
	Name	The name of the object. (Inherited from ApiDataObject .)
	Structures	Used for navigating to the child structures.
	UID	DICOM UID.

VMS.TPS.Common.Model.Types Namespace Eclipse Scripting API

VMS.TPS.Common.Model.Types namespace contains structs and enumerations shared across the Eclipse Scripting API.

Classes

Class	Description
<u>DoseProfile</u>	Represents a dose profile.
<u>DoseValueDisplayConfig</u>	Configure the settings related to the dose value display for the application. Defaults to the same settings as Eclipse.
<u>Fluence</u>	Represents the fluence for a beam. The resolution in the fluence matrix is 2.5 mm in x and y directions. In the fluence matrix, x dimension is the number of columns, and y dimension is the number of rows.
<u>ImageProfile</u>	Represents an image line profile.
<u>LineProfile</u>	Represents values along a line segment.
<u>SegmentProfile</u>	Represents the segment values along a line segment.

Structures

Structure	Description
<u>DoseValue</u>	Represents a dose value.
<u>DVHPoint</u>	Represents a value on a Dose Volume Histogram (DVH) curve.
<u>MetersetValue</u>	Represents a meter set value.
<u>ProfilePoint</u>	Represents a point of a profile.
<u>SegmentProfilePoint</u>	Represents a point of a segment profile.
<u>StructureCodeInfo</u>	Represents a structure code information.
<u>VRect</u>	Represents a rectangle.
<u>VVector</u>	Represents a displacement in 3D space.

Â	Structure	Description
Interfaces		
Â	Interface	Description
	<u>IDoseValueDisplaySettings</u>	Application specific dose value display settings.
Enumerations		
Â	Enumeration	Description
	<u>BlockType</u>	A type flag that tells whether a block is an aperture block or a shielding block. An aperture block is used to limit the radiated area while a shielding block is made to protect a sensitive organ.
	<u>CalculationType</u>	Calculation type.
	<u>DoseValueÂ DoseUnit</u>	The unit of the dose value.
	<u>DoseValuePresentation</u>	Types of presentation for dose values.
	<u>DosimeterUnit</u>	The dosimeter unit.
	<u>DVHEstimateType</u>	Represents the type of DVH estimate curve
	<u>GantryDirection</u>	The enumeration of gantry rotation

Fluence Members Eclipse Scripting API

The Fluence type exposes the following members.

Methods

Â	Name	Description
	<u>GetPixels</u>	Returns the fluence matrix.

[Back to Top](#)

Properties

Â	Name	Description
	<u>MaxSizePixel</u>	The maximum size of pixels for x or y dimension in the fluence.
	<u>MLCId</u>	The identifier of the MLC that is related to the fluence. The value can be empty or null.
	<u>XOrigin</u>	The x coordinate of the first pixel in a fluence map. The value is measured in millimeters from the field isocenter to the center of the first pixel. The coordinate axes are the same as in the IEC BEAM LIMITING DEVICE coordinate system.
	<u>XSizeMM</u>	The size of x dimension in mm for the fluence. The resolution is 2.5 mm in x and y directions.
	<u>XSizePixel</u>	The size of x dimension in pixels for the fluence. This corresponds to the number of columns in the pixels matrix.
	<u>YOrigin</u>	The y coordinate of the first pixel in a fluence map. The value is measured in millimeters from the field isocenter to the center of the first pixel. The coordinate axes are the same as in the IEC BEAM LIMITING DEVICE coordinate system.
	<u>YSizeMM</u>	The size of y dimension in mm for the fluence. The resolution is 2.5 mm in x and y directions.
	<u>YSizePixel</u>	The size of y dimension in pixels for the fluence. This corresponds to the number of rows in the pixels matrix.

    string unit
)
```

Parameters

origin

Type: VMS.TPS.Common.Model.Types.VVector
Origin, i.e. position of first point of the profile.

step

Type: VMS.TPS.Common.Model.Types.VVector
Step length and direction between points on the profile.

data

Type: System.Double
Array of values of the profile.

unit

Type: System.String
Unit of values in the profile.

SegmentProfile Constructor Eclipse Scripting API
Constructs a SegmentProfile.

Namespace: VMS.TPS.Common.Model.Types

Assembly: VMS.TPS.Common.Model.Types (in VMS.TPS.Common.Model.Types.dll)
Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public SegmentProfile(
    VVector origin,
    VVector step,
    BitArray data
)
```

```
public SegmentProfile(
    VVector origin,
    VVector step,
    BitArray data
)
```

Parameters

origin

Type: VMS.TPS.Common.Model.Types VVector
Origin, i.e. position of first point of the profile.

step

Type: VMS.TPS.Common.Model.Types VVector
Step length and direction between points on the profile.

data

Type: System.Collections BitArray
Array of values of the profile.

StructureMarginGeometry Enumeration Eclipse Scripting API
Specifies whether a margin operation expands (outer margin) or shrinks (inner margin) the volume.

Namespace: VMS.TPS.Common.Model.Types

Assembly: VMS.TPS.Common.Model.Types (in VMS.TPS.Common.Model.Types.dll)

Version: 13.6.19.0

Syntax

C#

VB

C++

F#

View ColorizedCopy to ClipboardPrint

```
public enum StructureMarginGeometry
```

```
public enum StructureMarginGeometry
```

Members

Member name	Value	Description
Outer	0	Specifies that the margin operation expands the volume.
Inner	1	Specifies that the margin operation shrinks the volume.

VRect T Members

The VRect T type exposes the following members.
Constructors

	Name	Description
	<u>VRect T</u>	Constructs a new VRect.

[Back to Top](#)
Methods

	Name	Description
	<u>Equals(Object)</u>	Checks if the object is equal to this VRect. (Overridden from Object)
	<u>Equals(VRect T)</u>	Checks if the VRect is equal to this VRect.
	<u>GetHashCode</u>	Returns the hash code for this VRect. (Overridden from Object)
	<u>ToString</u>	A string representation of the VRect. (Overridden from Object)

[Back to Top](#)
Operators

	Name	Description
	<u>Equality</u>	Equality operator for VRect.
	<u>Inequality</u>	Inequality operator for VRect.

[Back to Top](#)
Properties

	Name	Description
	<u>X1</u>	The X1-coordinate of the rectangle.
	<u>X2</u>	The X2-coordinate of the rectangle.
	<u>Y1</u>	The Y1-coordinate of the rectangle.
	<u>Y2</u>	The Y2-coordinate of the rectangle.

VVector Multiply Operator (Double, VVector)

The multiplication of a VVector and a double.

Namespace: [VMS.TPS.Common.Model.Types](#)**Assembly:** [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))
Version: 13.6.19.0

Syntax

[C#](#)[VB](#)[C++](#)[F#](#)[View ColorizedCopy to ClipboardPrint](#)

```
public static VVector operator *(
    double mul,
    VVector val
)
```

```
public static VVector operator *(
    double mul,
    VVector val
)
```

Parameters

mul

Type: [System.Double](#)
Multiplier.

val

Type: [VMS.TPS.Common.Model.Types.VVector](#)
VVector to multiply.

Return Value

Type: [VVector](#)

Result of multiplication.

VVector Multiply Operator (VVector, Double)

The multiplication of a VVector and a double.

Namespace: [VMS.TPS.Common.Model.Types](#)**Assembly:** [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))
Version: 13.6.19.0

Syntax

[C#](#)[VB](#)[C++](#)[F#](#)[View ColorizedCopy to ClipboardPrint](#)

```

public static VVector operator *(
    VVector val,
    double mul
)

public static VVector operator *(
    VVector val,
    double mul
)

```

Parameters

val

Type: [VMS.TPS.Common.Model.Types.VVector](#)
VVector to multiply.

mul

Type: [System.Double](#)
Multiplier.

Return Value

Type: [VVector](#)

Result of multiplication.

»

Eclipse
Scripting
API**VVector** Subtraction Operator

The subtraction of VVectors.

Namespace: [VMS.TPS.Common.Model.Types](#)

Assembly: [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View Colorized](#)[Copy to Clipboard](#)[Print](#)

```
public static VVector operator -(
    VVector left,
    VVector right
)
```

```
public static VVector operator -(
    VVector left,
    VVector right
)
```

Parameters

left

Type: [VMS.TPS.Common.Model.Types.VVector](#)
First operand.

right

Type: [VMS.TPS.Common.Model.Types.VVector](#)
Second operand.

Return Value

Type: [VVector](#)

Result of subtraction.

VVector Properties Eclipse Scripting API

The VVector type exposes the following members.

Properties

Â	Name	Description
	<u>Item</u>	Indexing for the x, y and z components.
	<u>Length</u>	The length of the VVector.
	<u>LengthSquared</u>	The square of the length of the VVector.
	<u>x</u>	The X component of the VVector.
	<u>y</u>	The Y component of the VVector.
	<u>z</u>	The Z component of the VVector.

VVector Item Property

Eclipse
Scripting
API

Indexing for the x, y and z components.

Namespace: [VMS.TPS.Common.Model.Types](#)

Assembly: [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))
Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double this[
    int i
] { get; set; }
```

```
public double this[
    int i
] { get; set; }
```

Parameters

i

Type: [System.Int32](#)

Value of 0,1 or 2 that correspond to x,y and z components.

Return Value

Type: [Double](#)

Returns the given component of this VVector.

VVector.X Property

Eclipse
Scripting
API

The X component of the VVector.

Namespace: [VMS.TPS.Common.Model.Types](#)

Assembly: [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double X { get; set; }
```

```
public double X { get; set; }
```

Property Value

Type: [Double](#)

VVector.Y Property

Eclipse
Scripting
API

The Y component of the VVector.

Namespace: [VMS.TPS.Common.Model.Types](#)

Assembly: [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))
Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double Y { get; set; }
```

```
public double Y { get; set; }
```

Property Value

Type: [Double](#)

Eclipse
Scripting
API**VVector.Z Property**

The Z component of the VVector.

Namespace: [VMS.TPS.Common.Model.Types](#)

Assembly: [VMS.TPS.Common.Model.Types](#) (in [VMS.TPS.Common.Model.Types.dll](#))

Version: 13.6.19.0

Syntax

[C#](#)

[VB](#)

[C++](#)

[F#](#)

[View ColorizedCopy to ClipboardPrint](#)

```
public double z { get; set; }
```

```
public double z { get; set; }
```

Property Value

Type: [Double](#)
